Jackie King from the Flying Eye 14/3/99

Certainty level: 40%

In early March 1999, Capital Radio alleged they had received some emails, one of which was forwarded to me. It contained the words, "you know this bloke, he says we're trying to kill him, we should be done for attempted manslaughter!" which Chris Tarrant had said in 1994.

Following these emails there was an explosion in abuse activity, both from Capital Radio, and from MI5 themselves. MI5 followed me around and hurled abuse at me. The following audio file contains what may be abuse from the radio station.

Jackie King from the Flying Eye made these remarks on Sunday (14/3/99) lunchtime 12.24pm; "gas main work being, er, HANDLED if you like (laughs, embarrassed) outside Madame Tussauds, Euston Road obviously feeling the backlash of that".

The key word is "handled", which she sounds embarrassed to be saying; to me it looks like an attempt at a sexual slander. Capital Radio aren't even pretending not to get at me any more. I asked Chris Tarrant several times about his remark from 1994, and he has consistently avoided answering.

Virgin Radio-Johnny Boy (21/August/1998)

Certainty level: 60%

On Saturday 15 August 1998 I attended a gathering of contributors to newsgroup uk.misc at London's Victoria railway station. Also present was Simon G, who had previously given this description of what he would be wearing;

At 06:36 AM 13/8/98 GMT, Simon wrote:
>further clarification to aid recognition, i'll be wearing
>a t shirt, a brown suede waistcoat, a brown suede miniskirt,
>& a pair of patchwork leggings (& may have a widebrimmed straw
>hat, too).

It is my belief that my persecutors, who monitor my home telephone line (and consequently read all modem communications including email), were aware of this meeting, and may even have observed the "meat" taking place.

Following the "meat" it seemed to me that one or two attempts were made by my persecutors to portray me as "gay", on the basis of Simon's suede miniskirt, which in their inventiveness my persecutors attributed to me, not Simon. (Just for the record, Simon is hetero, and has agreed to the above email extract being published.) The following item from Johnny Boy's Wheels of Steel (between 7pm-11pm, Friday 21/8/98) is one such attempt.

(conversation) (J=Johnny-Boy, H=Hipster)

J: Texas of course part of V98 this weekend enjoy it if you're going. Keep your eyes out on Sunday in Chelmsford for Hipster, because he's going to be there. What are you going to be wearing?

H: I'll be wearing my, er, my suede shorts.
(sycophantic laughter)

J: and believe me he ain't joking, he ain't joking. OK coming next at Virgin on the Wheels of Steel...

Why do I think Hipster's "suede shorts" refers to Simon's mini-skirt? Because "suede" in both cases (obvious!); because "suede shorts" indicates "gay" which they were trying to pin on me; because "shorts" = something short, such as a "mini"-skirt; and because the two DJs both laughed as soon as Hipster said "suede shorts", they knew what the joke was, they knew that they were meant (and probably paid) to find it funny.

Virgin Radio-Johnny Boy (19/June/1999)

Certainty level: 30%

I'm not quite sure about this one, so I've given it a one in three chance of being about me. First the background.... from mid-March 1999 for some three or four months, every weekend, I bombarded Westminster MPs with faxes about the terrible, all-encompassing MI5 Persecution. (Jesting aside, it really is terrible and all-encompassing, in the UK anyway.) Of course each week some MPs replied; but in June 1999, after I'd been at it some three months, I started getting "covert" feedback from Virgin Radio.

The first feedback I got was from Danny Baker, on Sunday 13th June. That weekend I was sending an article which contained biting criticism of the police inaction in this case. Danny Baker on his Virgin radio show started an angry rant that "he knows it's rubbish", ie. he was rubbishing what I'd said in that weekend's faxed article. Unfortunately I wasn't recording this programme.

The next possible Virgin-Radio feedback was a week later on 19th June 1999. This is contained in the audio file above, in which Johnny Boy on his "Wheels of Steel" programme says;

"and if you would like to put a triple play together, ahhh.... because quite frankly Hipster and me are running out of ideas...."

He goes on to counter Hipster's "how dare you" with a protestation that he is "only joking".

What I reckon is that my article faxed to MPs that weekend was forwarded by one of the recipients to Virgin Radio. My article had included the words;

"I am beginning to run out of both new topics and energy to write these articles."

So what I reckon is that Johnny Boy read the article.... and rephrased the above line "run out of ... new topics" to "running out of ideas". I recognise that this is a pretty tenuous inference to make.... but do listen to the audio file, from the "ahhh...." pause in JB's speech you can guess he is about to say something "risky" and at someone's expense. Anyway, I listen to the Wheels of Steel regularly and will continue to do so, recording it as I always do - so any future funny remarks will get immortalised on these pages!

Brighton Day Trip - 24/Sept/1998

Certainty level: 5%

On a day trip to Brighton, carrying a minidisc recorder, I managed to collect several indistinct instances of what I think were people swearing at me. Between the 0.5 and 1.5 second marks of the above recording is something that sounds like "nutter". I recorded at least three other much more obscene sexual words on the same day.

I don't honestly think the "nutter" recorded here is part of the conspiracy against me. I've been called similar things elsewhere, where it's been blindingly clear that the insult does form part of the conspiracy - but not in this case. This illustrates quite a worrying point - as a result of the many years of abuse "in public", I now sometimes simply don't know whether somebody is insulting me because they think I look like a dweeb, or whether the conspiracy is in action. Sometimes, due to background noise and people talking quietly relative to ambient noise, I can't be sure of what's being said, even after listening to it again on my minidisc. Or put another way, I now have a mild form of what I recognise to be occasional auditory delusions - but these are fuelled by the many years of actual verbal abuse.

POSK Cafe - 2/Feb/1998

Here are two independent segments, both of which occurred in London on the same day, the first at a Polish cafe, the second on the Tube.

Certainty level: 100%

POSK is the Polish Social-Cultural Centre in Hammersmith, London. It has quite a nice cafe which does pierogi, golabki etc. I went there with my mother early in 1998. Seated at the window table were three Polish men talking amongst themselves. One of them let rip with a sexual obscenity which was clearly directed at me (it's the same one that's been heard again and again since about November 1995), and which was recorded on my minidisc walkman. I have not included it in the above excerpt, which shows the reaction of another of the trio to the first man's swearing - namely, "jestes swinia jednak" which in English is "nevertheless you're a swine".

Certainty level: 20%

Somewhere on the London Underground. "Psycho" (I think - a little unclear).

Leicester Square - 9/Feb/1998

In February 1998 I spent some time in Leicester Square, in the West End of London. This is a very busy area of London, and one which can be relied on to produce "contacts". Capital Radio's offices and their cafe are located here, the Trocadero is nearby, and the place is full of cinemas and entertainment venues.

Certainty level: 100%

A young girl is heard to say, "Alright I'm going to talk to myself" to her friends, followed by all of them laughing together, as I passed by.

Believe me, I do not look mad in real life, these young people would not have directed their comments and laughter at me unless they had already been told by others that I was ill. I am absolutely certain that their behaviour was directed at me, and this audio file is particularly clear.

Certainty level: 60%

This one was recorded in a cafe in Green Park. Two women are talking to each other, one of them says to the other, "something wrong with him", with an emphasis on the "wrong".

The words "something wrong with him" have been repeated at me dozens of times, at my former workplace in Canada, in England, etc. The words are quite deliberately chosen to have two meanings; they obviously imply that I am ill, without forcing the abusers to demean themselves by using more pejorative terms, although they have shown that they have no compunction in that area; and secondly, the words "wrong ... him" make me at fault, and place the guilt for the abusers' wrongdoing on my shoulders.

Certainty level: 30%

Recorded on a Victoria line tube train leaving Green Park station.
If you listen carefully you can pick up the word "hunchback". The speaker had emitted a swear word immediately before this excerpt; both the swear word, and the "hunchback", were (I believe) directed at me.

I agree ,This looks to be a club project , The kind you might find in G-E
HAM NEWS
They have a 6 meter radio in July - August 1955 that looks a lot like this
radio
BAMA does not have all issues of G - E HAM NEWS
I live in Indiana and might have gotten this at the Peru hamfest .

Thanks   Garry   WW9GT

Which model? There is mention of the earlier ones in Frayne and Wolfe
and in Read's _Sound Recording_ I believe.

Hi all;

I have a Hammarlund HQ-110 that has a burned up 455Khz IF can,
specifically T3 in the schematic.
The Hammarlund part number is listed as K38829-2 Does anyone have a
spare one, or a junked
chassis with one? Please e-mail me directly at:

Don Levstik
wd5jbc@verizon.net

Thanks,

I need a PTT Relay for the Drake TX4C. Does anyone know where I can get one?
This the PTT, Muting, Bias Control Relay in the TX4C.
It is the plug in type with a 14 pin socket. The one in this TX4C
was made in England. It is a Clare/Varly brand with a 15K resistance coil.
It also has VP4 and CAB-120 printed on it. Thanks, Charlie Hugg, K5MBX

Hi Garry:

I would be willing to bet a nickel that it is a club project. With 5 tubes, it sounds like a super-regen receiver. Check out the Heath Twoer. That was super-regen. See if the tube line-up is similar.

This is probably a big "duh" thing to say, but it was probably
connected with the Toledo Mobile Radio Association
<http://www.tmrahamradio.org/>, so you might want to
contact them, if you haven't already.

Potter & Brumfield R10-E1Y4-V2.5K is the standard relay in all the
T(R)-4 (any) transmitters.

The Varley relay is a 15K coil, which meant very fine wire. There was
a fairly high failure rate caused by the wire breaking, possibly
because of the heating and cooling cycles of the transmitter.

The only change necessary to use the 2.5K ohm relay above is to add a
1.5K, 1/2W resistor in series with the coil.

They're available from both Digi-Key and Mouser for about $15. They're also available from Newark, and probably their Farnell division in EU.

S.T.W.

I have happened onto a second Johnson Valiant I transmitter, a factory-wired model. If I did not have another V-1 in comparable condition (mine has all the ER audio mods), this one would be an absolute keeper. No mods done other then the one that accommodates the EFJ SSB adaptor. Front panel is in excellent condition. The inside top chassis is clean and absolutely no signs of rust or corrosion on the iron. The underside is a joy to behold. It looks like out-of-the-box, literally! I have begun to replace the electrolytics and may proceed with the important VFO screen resistor mod. If there's someone in the mid-Atlantic area looking for a truly excellent, collector-quality Valiant, this one is it. I'm asking $300 as it now stands (although the caps will have been changed out, and the rig already has some 3B28's in it). With the VFO mod gets done, it'll be a bit more. I have all the requisite books and the SSB Mod sheets. No shipping* as I'd like anyone to see it first. Be happy to meet anyone an hour or so distant from the mid-Maryland/DC area. I do not believe that you will not find a nicer Valiant....anywhere! JPEGs available.

*Valiants don't take to shipping, anyway, and I simply won't risk the ride...

73 de Jeep/K3HVG

Rick,

I'm not a ham but Dad was, I'm just a real serious DX'er and boatanchor collector.

These are my pics....

NC-183D (dad swore by it that it was the best ever made)

NC-173 (they took it on an epic ocean voyage for a reason)

NC-88 ...easiest to come by in good shape

Thanks for letting me have my input

Antique Radio Supply -- www.tubesandmore.com.

They have individual white boxes, and they have "egg cartons" for storing lots of tubes.

Or, they did the last time I looked...

I'm trying to resurrect an old one I bought in 60's, and can't find the original instruction sheet. It was a single sheet of paper, folded to the size of a business envelope, and it had the whole shebang on that one sheet. I have a copy of the newer version now sold by MFJ/Hy-Gain, but for some reason the side element sizes do not seem to be the same. For instance, the 40 M element is shown as sticking up about 80" above tower top, I don't remember it sticking up that far.

Anyone know an online source that may have this? I wrote to MFJ and am awaiting a reply, but if I can find it for free and quick it would be nicer... he he...

73,

Jim, WA5DXP

Vacuum tube cartons are usually expensive. I would not have a source to recommend you.

But if your purpose is only that of storing your octal tubes safely, you may do it the way I do it.

I first wrap the tube with newspapers paper and then push it into a carton cylinder salvaged from toilet paper. I am not sure whether the inner cylinder of US toilet paper is rigid enough to do the job. Our is perfect.

Then I write tube type on the carton side.

```

I'm working on yet another Valiant I. This one has the Johnson SSB adaptor wiring modification kit installed (if that is an issue?). All appears to be well, RF out, etc. but I have a question regarding one of the meter readings. In the oscillator position (6CL6 buffer cath. current), I get a continuous 10ma reading, key up (idle current, if you will). Key down, I get an expected swing upward, the keyer circuit appears to work OK, and the unit transmits with nothing untoward happening. On the other two Valiants I have, there is no measurable current in the osc. meter position, key up. I've checked virtually all components in/around the buffer and keyer circuits with no problems detected. The only issue is that the derived grid bias on the buffer is -3v vice the -5v called for in the book. That may be the reason the buffer is idling at a higher current... but why? What is not provided by Johnson is a re-drawn schematic after the somewhat extensive re-wire job for the SSB adaptor. I could just ignore the issue as the 6CL6 is still well within its operating range. Maybe someone else has had this come up and/or its normal after the mod has been done? The mod book makes no mention.

Thanks for any insights. de K3HVG

FS: Amp Supply LK-800-A
Has three tubes in it: 3CX800A7's
Its a power house. Works and LOOKS
EXCELLENT!!!! No problems at all.
I use it on the air everyday.
I've seen these go on ebay in the past for 2900.00
I want 2000.00 Plus shipping...FIRM!!!!!!!
As stated nothing at all wrong with amp!! And for its age, Its a
Beauty!!!!

I would assume that maximum selectivity occurs when the 85 kHz IF trasformers actuators are fully pulled up (maximum distance between primary and secondary windings).

Can any one please confirm or deny?

Yes. As the coils are more closely coupled the bandwidth increases.

Hi Jeep:

I am responding from a dark hole - guessing. A shot in the dark, so to speak.

I am guessing that the 6CL6 was converted to a class A stage for use with the ssb adapter. The basis for this is my vague recollection from an early Single Side Band ARRL publication by Father Morrison, who was a teacher of one of my friends. He converted a Viking II for use with a Central Electronics 10A sideband rig and basically did the same thing to a driver stage (maybe a 6AQ5), using it as a class A stage.

So, what is good for the Viking II ought to be good vor the Valiant. I think the article may have been in a 1955 or 1956 QST.

How is that for pulling out trivia from way back and applying it to a different set of facts?

73, Colin K7FM

Tony:
http://site298.webhost4life.com/barryhauser/archives/HSN-Accessories.pdf
would seem to confirm your theory.

www.qsl.net/k5bcq/HK/HK.html says:   (you may have to move the figures
to the correct columns)
IF Transformer       Center Freq  BW -6dB  BW -20dB  BW -40dB

BC-453 IF (#12012) 85Khz    3.0Khz          10.0Khz            26.0Khz
     Notes (4)(6)
BC-453 IF (#12012) 85Khz    5.4Khz          14.0Khz     ---
        Notes(5)(6)
two BC-453 IFs (#12012) 85Khz    1.8Khz          4.3Khz        11.0Khz
     Note ( 8)
Notes:
4.With the Micarda rod "OUT". BC 453 IF coils have a "Q" of about 50.
5. With the Micarda rod "IN" (over coupled)
6. One of the BC-453 IF trimmer caps was modified so both trimmers are
across the fixed padder capacitors.
With both Micarda rods "OUT" (not overcoupled) ....very sharp for SSB

>

But I thought a lot of those things had enough oomph to drive the output stage directly.

The 10A was classified as an exciter, and the schematic in the CQ SSB book shows a 6AG7 in the output of the 10B (and the ad in the back says it's good for 10watts). The SB-10 adaptor schematic in the same book has a 6BQ5, and the text even says you'd basically break the connection between the driver and the output stage, and connect the adapter there.

Given that these have actual output stages that use driver type tubes, I would have thought it was simpler to just drive the output stage directly.

Michael VE2BVW

You release the energy stored in your power supply filter caps and it's done
by using a specialized lead made up of a resistor of adequate size and value
with a alligator clip on one end and a insulted test probe on the other.
Never discharge a capacitor strait to ground. It can damage the component.
Google "capacitor discharge lead"

Not worded well, what I meant was that open wire lines
were used pretty much exclusively until TVI became a
problem. Then coax started to replace it for many
applications. Open wire still has virtues not duplicated by
coax, low loss being one of them.

The Espenshied patent is very intresting, among other
things it has an illustration of a _video phone_ on page 5
of the drawings. The patent talks about wide band
transmission, several megacycles, for transmitting
television.
What he describes is air dielectric coax not the solid
dielectric flexible stuff we mostly use in ham radio. I will
do a Google patents search later and see what I can find.

One advantage is that you can make your own. That must have
made it popular in the depression era, indeed I'm not sure
that commercial open line came along until later.

Even in the fifties, you'd often see "Hints & Kinks" type
things in the various magazines about household items
that were suitable as spacers.

I seem to recall reading at some point that coax faced
a certain resistance in amateur circles, because it was
a commercial product when before that people just made
their own open line.

Does anyone know the specs for a replacement of the pilot lamps
behind the main tuning dial?

The original Yaesu part number was: BQ154-33811A.

One source said is was 12V. 100ma. Is this correct?

Both of mine burned out as I flicked the `light' switch
off and on.

The lamps are those `grain of wheat' types . . .

Any help or suggestions on replacement or a source would be
appreciated.

Hi Bill:

Whenever possible, I replace those grain of wheat bulbs with leds. You will need a current limiting resistor. The led has a limited pattern of light, so it will not work if you need light from the side of the bulb. Most of the time, the led will work fine - and be permanent.

You can choose white or various colored ones. In some radios, the reduction in battery current is substantial.

I think by the sixties, the standard spacer were those plastic
perforated hair curlers :-). Wow, that takes me back to my childhood!

Tim.

I had a CB come in once which was new - but blew bulbs out like once a week. The tech who worked on it - never tried to remedy the problem aside from replace bulbs - twice - maybe 3 times. All seemed ok - aside from the bulbs being eaten alive. I placed a small resistor in line - no more blown bulbs.

[snip]

Testing actual old mica caps before use is good advice, but there's no need to test anything above .001uf branded "Micamold". The notorious Micamold was a paper cap in a mica type domino case. The values typically run in the paper cap area, say .01 or .02 uf at 600V.

I'm sure I've also seen tubular Micamold caps. The tubular Micamolds seem less disingenuous but are no more reliable.

I find that very odd! PVC plumbing pipe doesn't get
warm in a microwave, which is pretty good. Plastics
usually are pretty linear in their attenuation vs.
frequency graphs.

And, I have used PVC for antenna insulators on my HF
dipoles for years, and never noticed a problem.

Can you elaborate on your findings? Things such as
cellular core vs schedule 40 vs CPVC, size of pipe, and how
you observed the problem would help.

Thanks!

-Chuck

Also, I have an 8505A network analyzer. Any ideas on how I could
best test your hypothesis? I suppose I could make a cylindrical
capacitor, and see how it's impedance varies with frequency over
the HF frequencies... or maybe make a piece of coax out of some
PVC tubing and some copper?

You know, the last time I tested this, it was before microwave ovens were common in the market.

>And, I have used PVC for antenna insulators on my HF

At the center node? Hmmm.

>Can you elaborate on your findings? Things such as
>cellular core vs schedule 40 vs CPVC, size of pipe, and how
>you observed the problem would help.

I noticed this with the generic thinwall drinking-water pipes back in the seventies, and there was some discussion in QST about it at the time.

There's no reason for PVC itself to be a problem, so the assumption was that it had to do with some of the fillers. For all I know, it may not

be a problem with modern PVC formulations... I agree that the microwave
oven test is usually pretty conclusive.

Well, there are quite a variety of baluns that use PVC tubing as
the center insulator (w2DU, K2AU, or something like that). And,
I have used PVC tubing as the coil form for loading coils used in
shortened and multiband dipoles. And I have used short chunks of
PVC tubing as the insulator for the ends of dipoles. So that covers
most of the field combinations ranging from high E/low H to high H/low E.

I don't run a whole lot of power, but with 150W output I haven't
noticed any burning or melting... That, of course, doesn't mean
that I haven't lost significant amounts of signal without my knowledge.

I guess the big question is what makes the tubing white? If it is
something like zinc oxide, perhaps that is what is causing the concern?

I STILL have a quantity of Test Equipment and Radio Communications Service
Manuals,
both Commercial & Amateur.
I started out with a LOT...but still have enough to prevent getting the
Explorer into the Garage!

Most of them are in Like New Condition.

Prices are reasonable...mailing may more than the manuals..depending where
you live!

Please check my site: www.rodemi.com   for what is available.
Click on the MANUALS Heading.

I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like
these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI

For any one contemplating ordering from Norm - he is cool to deal with -
don't fret it. I just got a bunch of manuals from him and would deal with
him again - in a heart beat.

According to the Wireman's Wirebook IV, coax with the government's
"RG" legend goes back to the Forties.

R=radio frequency
G=government
U=universal use

"Coaxial line" is also described in my 1942 Special Defense Edition of
the ARRL Radio Amateur's Handbook, tho' there are no ads in that
particular edition.

Beyond that, the trans-atlantic cables laid in the early part of the
century were "coax" but maybe a little heavy for amateur use.

Hi Bill,

Hobby shops are good places to shop for grain of wheat lamps (typically available in 6V and 12V types). Two issues with using 12V lamps:
a) your AC power supply or automotive charging system supplies 13.8V but the lamp is rated for only 12V... running current will be high (lifetime will be significantly shortened).
b) the inrush current (often several times the running current) is quite high, even if you regulate the voltage. The lifetime is again shortened.
You can use a *current* regulator, set to some value less than the lamp's

current at its design voltage. For currents less than 100mA, the LM317L would be an excellent choice and is super easy to implement.

Colin (K7FM) suggested replacing the incandescent lamps with LEDs but mentioned the dispersion angle would be very narrow (creating a spot of light). A friend who runs a service shop for commercial sound gear tipped me off... grind/file/sand the lens of the LED. The LED will now have a very wide dispersion angle.

73,
Bryan WA7PRC

Mouser has a pretty good assortment, and unlike the hobby shop, you can find the actual specs for voltage, CP, and hours life.

Scott -

Mouser carries the Kobitone (Far East) crystal element (see their on-line
catalog)
They are a bit smaller than the original Astatic -- BUT work fine

I've done some downloadable manuals over the years. Some of those he offered - I was unable to find - Googling and through some of the various manual sites. I got original manuals (a bunch of them) - in decent condition - from Norm, a lot cheaper than burning up my printer ink. I'm happy.

One of the manuals - I had gotten a "copy" of a couple years ago. It was missing some information, some was very unreadable - copied too dark. I paid almost the same amount for it as I did for the bunch - including the "original" which I "can" read.

To each his own. Everyone has a choice to make. I made one and am happy with it. Just leaving it at - Norm is a good guy to deal with - if you wish to purchase any of his manuals.

Thanks for all the replies and suggestions.

I am in Denver, and Fistell's a long-time local electronics
supply house whose life has been in limbo since death of
original owner had some 12-14 volt bulbs which I successfully
installed. The lamps came with the rubber insert bushings . . .

Price was $2.49 each. This was for the MAIN tuning dial on the
radio which uses TWO.

There are six other lamps, 4 for the PRESELECT dial and
2 for the MHz dial (which are still good). But these are apparently
a slightly different bulb according to the schematic & parts list.

They have about 50 more similar `wheat grain' lamps.
Their part number for this bulb is: BPCY-0081001

For anyone interested, Fistell's is at 1001 Bannock St, Denver.
Phone: 303-393-6000

Vintage radio tubes from 1947 Sparton radio

Currently I have 3 USA made vintage radio tubes up for sale:
Sylvania 6E5 "Magic Eye" (no way to test, looks great comes with socket)
Tung-Sol 6S8GT (tests good on Sencore TC28 tester)
Sylvania 7Q7 (tests good on Sencore TC28 tester)

I recently salvaged these tubes from a 1947 Sparton 10-76-PA radio that
was put out for trash pickup. I was on foot and the garbage truck was
literally a few houses away so I couldn't save the whole thing, but I
grabbed what I could & put some of the tubes I can't use on ebay.
If interested, please check them out.

Pickup available for radio fans local to 53538 WI zip code to save shipping.

Cheers

All start at $0.99 with no reserve on ebay:
http://search.ebay.com/_W0QQsassZgnarles

p.s., I also don't jack up stuff with 'handling' or other BS charges.
Real shipping costs only.

I'd rather see these being used by someone who will do something with them.

I have an HP 8414 polar display that I'd like to use as a standalone
unit, outside of the HP 8410 network analyzer that it's designed to
plug into. I know HP made a device to do this called an HP 8418, which
is of course long discontinued.

I'm looking for a manual for either the 8414, 8410, or 8414 which will
show the connector pinout on the 8410. When HP was still HP, the local
office always had all the fiche on everything and old equipment was very
well supported, but the local Agilent guy basically laughed when I asked him
about this one.

Are they still open? When I was working at DFW airport last year,
we went by their place (and I want to think it was in Aurora) to

find it was all boarded up. Wound up paying Digi-Key to overnight
some connectors to us.

not totally and completely unrelated to ham radio- this is a Collins
control used with (as I recall) and APDS-105 autopilot - though memory may
not be totally accurate - anyway, it has a couple of pots inside so it could
be used as a fader or something, but more interestingly, if you have a ham
shack with a bunch of Collins gear, mounting this somewhere and not even
hooking it up could make your friends green with envy (hey, I don't have one
of those, what's it do?   well, it adjusts the SSB bandpass rolloff......)
you get the idea.

here's the link
http://cgi.ebay.com/ebaymotors/ws/eBayISAPI.dll?ViewItem&item=300167951551

you will note that it has the old style "meat ball" logo, not the Rockwell
induced BOHICA - dates from teh 70s sometime

I have the manual for the 8410.  I'll put the pinouts on the binaries
as soon as I get my scanner fixed.

I have checked this and believe it is genuine, otherwise I would not post it, and may the moderators castigate me if I am wrong. You judge. The text is what I wrote to my friends. I'm repeating it here because it's appropriate.

==

I am talking about them crushing valuable property: F-150 pickup trucks, digital cameras, and TV sets, even stuff like new light bulbs and electric can openers, all things that should be sold surplus to recover tax monies. All these things have been sold surplus for decades recovering many millions of $ each year. Now they will waste it all for nothing, for scrap value to the lowest bidders -and use federally paid labor to scrap it, more waste.

what to do with BA? well, some radio electronics stuff does still come through.

==[][][]

The whole story and an appropriate and respectful form letter is here on the GSBA site:

http://capwiz.com/sboa/home/

==[][][]

On the website, you just fill out a form and it automatically sends a letter to the correct representatives.

Gee... the last batch of 10 ($10 US/pkg) I bought from the local hobby
emporium were marked:
```

Mfr: Miniatronics Corp
PN: 18-028-10
Voltage: 14V
Current: 80mA
Dia: 5.5mm
Average Life: 10,000 hours
Website: http://www.miniatronics.com/

The light output wasn't listed but for the price/availability vs the non-critical application, it's not much of a gamble. They have lotsa other stuff as well, and have a dealer locator on their website. Again, if using incandescent lamps, limiting the inrush current will maximize the life of the lamp. I used an LM317L + one resistor to do that.

That's great! I am more used to them being marked something "useful"
like: locomotive lamp, or street lamp, 12V...

Mouser sells that same lamp (by Chicago Miniature Lamps) for $0.43 each
in a pack of 10. They have no minimum order.

Cool. Because of pricing, I've found myself buying from Mouser (and even
Allied) more often and Digi-Key less often. For dial backlights, I think
I'll give the white LED another try, the next time around. I want to try a
friend's suggestion to file/grind off the lens in order to increase the
dispersion angle.

I've done that as well. In some cases where I can, I will string 3 or 4 LED's
in series and use them to light up the dial.

White LED's are funny devices. As I understand things, they are actually
blue LED's with a phosphorescent component added to the plastic of the package.
The phosphor is what makes them radiate white. I have a suspicion that filing
them may damage the color. Old fashioned GaAs LED's dispersion can readily
be improved by filing the end of the lens.

Yes, you can't file the whole lens off, but you CAN rough it up with a bit
of sandpaper to create a diffusing surface. You don't want to take any more
material off than you have to.

Would like to obtain SW-3 coil forms, but do not see any advertised. Is
anyone making blank coil forms? Is there a website containing information
for "rolling your own".

I have all the winding data. Just need forms.

Thanks, Colin K7FM

Re: wide angle LEDs:

Check out:

http://ledsupply.com/

This is a white wide angle (70 degree) LED

http://ledsupply.com/l1-0-w5th70-1.php

Also of interest - is

http://ledsupply.com/l1-0-ww5th50-1.php

which is a warm white 50degree - VERY bright- and mimics incandescent pretty well - esp. if you "throttle them back" (i. e. run them 10-15ma istead of rated 20ma).

Of course - they still aren't "global" like true incandescents - but with the low current drain - you can afford to use several for the same power budget... and aim them along a path, etc.

best regards

Hello all,
I am wondering if there are any interesting ham or just plain ol' electronics stores in the Detroit area that are interesting to browse? I am spending a lot of time in the Detroit area and occasionally have an afternoon free and could use a suggestion as to where the locals buy their stuff? Any good parts outlets too? Thanks.

Smokey

Keith Martin, W7KGV used a rig that was a wonder to watch. Whole garage floor covered with used automobile batteries, charger working 24/7 for a few days, then the fun began!

BC-375 (from B-17's and B-24's) ran off 28vdc. Motor generator turned out 1000vdc for the rig. Basically an MOPA (remember????) with a VT-4C oscillator and another for PA. (now the VT-4C's around are for audiophile's output tubes... some now referred to as 211's)

The MOPA transmitter worked on all bands, with proper tuning unit, up through 20 meters. Best output was on lower bands, 40 meters was Keith's favorite, as his "off-center fed extended Zepp" antenna fit on his lot, with just a little over on the neighbor's lot.

Keith could contact "ZL's" in the evening, with reports ranging from 336 to 589C. (Honest operators always included the "C"in the signal report, as the BC-375 had a distinctive "yooup di dit dit" which the "C" designated as a chirp, but was closer to a Yooup) It got really distinctive when the batteries ran low, and the filaments dimmed and the motor generator almost stalled on long CW dashes.

Keith eventually mastered a "bug" and increased his operating speed so more than one contact could be made before the batteries went dead again.

Receiver was the venerable BC-312, which had a handy crank on the tuning knob to follow the "state of the art" signals as they drifted around the band.

Some, who disliked drifting around on the bands, invested in a pile of FT-243 surplus crystals for other rigs, that didn't eliminate the friendly and reasuring "chirp", but didn't make drifting so much of an issue.

Old Chief Lynn, W7LTQ

Lynn, Not a few of us currently have BC-375's and '191's on the air,
regularly. With a bit of tweaking, FMing can be "minimized" but they
still drift. I'd like to find the xtal control mod that CAP used in the
50's for these rigs! Power supply wise, fortunately, currently there
are supplies capable of running (at least) the DY-88 24v dynamotor and
ac HV supplies are also around for both. They do present a very
impressive setup when the BC-348 or BC-342 are included, along with the
other SCR- accouterments. Look for some of these on the Old Military

Radio Net, an East Coast, early morning net on Saturdays on 3885.

One can't buy a new and complete SCR-284 for about $100 anymore, but nice gear does show up from time to time.   I was lucky and got a new one a few years ago.... a time machine, to be sure! de Jeep/K3HVG

I have my Hammarlund HQ-170 receiver running in the garage. I noticed something that I cannot explain and thought someone here might be able to shed some light on the subject.

So, I'm listening to some operators talking and all is well when some noise (scratching, like electrical noise) starts and gradually gets louder in the audio. If I turn my florescent overhead light off, the noise goes away and all is quiet and easy on the ears. Turn the light back on, and all is good. After a while, could be 2 - 15 minutes, the noise comes back. Again, turning on or off ANY light in the garage will immediately kill the noise and all is well again. Let me repeat. Turn ON or OFF ANY light in the garage will immediately kill the noise. Now, I could see the florescent light causing the problem by having it on, but what gives on actually making the noise go away? Is this something with the radio? Is there something I can do to remedy this? Why is this happening?

Thanks for your time reading...

It appears the noise is coming from the fluorescent light. Apparently, any additional load will change the pattern of the noise - but it still comes from the light.

You can do a couple of things. First, you can build an rf filter into the light fixture. I have done this before. An old LC filter from a computer works dandy. You need to be handy with electronics and of course it will void your warranty and if you burn your house down, do not look to me.

Secondly, you can get another light fixture. Some are filtered better than others.

Third, If the light plugs in, you can get a computer filtered outlet (has to have more than the surge suppressors) and plug it in.

As the bumper stickers says, "Noise Happens".

The "Surplus Radio Conversion Manual" describes a modification to change
the BC375
oscillator into a buffer amp. It recommends using a external VFO and
suggests using
a SCR 274N or a BC459 or a BC696 (after conversion) as the VFO.

My copy is Volume 2 and is dated 1948.

Cheers
Bill K7NOM

Wow! I'm going to have to try listening! I don't remember hearing a
BC-375 on AM phone!
Around 1959 I got mine new and complete for $50. Another young man had
just paid $75 for it and decided he didn't want it any more. After using it
a few months, I tore it up for parts and ended up with a push-pull final
amplifier. (using the VT-4C's, of course, and the plug-in coils borrowed
from another friend's BC-610) Always had some remorse about parting out the
BC-375 with it's tuning units, and antenna tuner, but sure had a lot of fun
building stuff with the parts.
The modulation transformer worked great in a much later (1958) home
brew 15 meter rig. Oh, how the bands rocked in those days!

It is true, but it's been true for many, many years. I spent a lot of
time carefully resoldering cable assemblies that had been hit with bolt
cutters in order to demilitarize systems... spent time unbending chassis
and finding replacement meters for gutted ones.

I strongly support this, although I don't think it will do a whole lot
of good. The mangling of items to prevent military re-use has been
going on since Vietnam, and it's been excessive because the people at

the DRMO don't really know what the equipment is or what it's for.

All, I've looked over the external driver modification and have chosen
not to do it owing to the mods required to the TU's... at least at this
time. I know for a fact a rather simple xtal control mod was done to
these rigs for CAP. Our Wing had a number of the BC-191s and they
worked OK into the early 60's. Unfortunately, those who would have been
privy to the technical aspects of this don't appear to recall or aren't
around, anymore. All I can remember is that there was a little Bud Box
attached to the lower left side of the transmitter. There was no ARC-5
or anything else of consequence, outboard except I seem to recall that
this crystal oscillator drove the VT-25 (10) oscillator tube and
something about only one wire/connection associated with feedback in the
TU being disconnected? Does that seem plausible? That's all folks........

I would like to build an old-style receiver using a BC-453 stuck at 500-kHz as IF chain. A possibility would be to put a pentode in front of the BC-453 mixing the incoming RF signal with the signal generated by a variable local oscillator (VFO). To improve selectivity, one could adopt a regenerative arrangement whereby part of the pentode plate signal is fed back into the grid (by inductive coupling), and the cathode resistor is then adjusted just before the tube starts oscillating. In other words, a kind of Q-multiplying converter (I think this is called "Q-dyne" receiver). What I am not fully sure about is if the increased selectivity I so obtain turns into a higher rejection of the image frequency, or just into a narrowing of the received bandwidth (which is already narrowed down by the tight BC-453 85-kHz IF transformers). My feeling is that said regenerative scheme would offer no advantage in terms of image rejection, but I would value very much your opinion on that subject.

James Fred was producing replica coil forms which I last purchased about
a decade ago. I don't know if he is still doing so. I was not able to
find anything on the web about repro forms.

FS: Alpha 77D Mint Condition!!!!!!
This Alpha has new front and side panels. New front panel says 77SX,
But its the 77D, This is a later model 77D and the later Peter Dahl
power transformer. So if you buy the kit they sell online, you can add
and have two 3cx1500a7 tubes inline.
I have a spare tube 3cx1500a7 full output which will go with this
sale. Not only is this a BEAUTY!!! But also works like NEW!!!!!!!!!
Nothing wrong with it at all. 4500.00 Pick up NJ

For CW reception, the Q-multiplier can give you tighter selectivity without
needed crystal or mechanical filters in the signal path. It's a pain in the
neck to operate, though.

Build yourrself a conventional super-regen receiver, then add a q-multiplier
stage after you have the rest of it working.

Your feeling is correct -- regeneration in the IF will narrow the IF
response, but won't correct for images before the IF. If the following
receiver suffered from images you'd correct them, of course.

I've seen designs in old handbooks that used regeneration in the RF stage
to sharpen up the response there -- that would, indeed, help the image
rejection at the expense of intermodulation performance.

I agree, but in my case regeneration occurs in the converter stage, not in the IF amplifier! That is reason why I am wondering about.

With a 500 kHz IF, I would have images only 1 MHz away. So I am worrying about the image frequency.

"Antonio Vernucci" (vernucci@tin.it) writes:

> I would like to build an old-style receiver using a BC-453 stuck at 500-kHz as IF chain. A possibility would be to put a pentode in front of the BC-453 mixing the incoming RF signal with the signal generated by a variable local oscillator (VFO). To improve selectivity, one could adopt a regenerative arrangement whereby part of the pentode plate signal is fed back into the grid (by inductive coupling), and the cathode resistor is then adjusted just before the tube starts oscillating. In other words, a kind of Q-multiplying converter (I think this is called "Q-dyne" receiver). What I am not fully sure about is if the increased selectivity I so obtain turns into a higher rejection of the image frequency, or just into a narrowing of the received bandwidth (which is already narrowed down by the tight BC-453 85-kHz IF transformers). My feeling is that said regenerative scheme would offer no advantage in terms of image rejection, but I would value very much your opinion on that subject.

A) There's really no reason to "boost" the selectivity of the BC-453. They were once seen as the ultimate in selectivy, at a time when there were few options. If the IF is too wide, then you need to adjust it.

B) The Q-Multiplier works by adding regeneration, but the prime point is just before it oscillates. Which means that when you need it to oscillate to provide a beat note, you lose control of selectivity. And the proper point is so sharp that external factors will kick the circuit into oscillation. Which is where the superregen came in, keeping it at that crucial point of highest gain without the need for crucial tuning (but incidentally bringing other problems into play).

C) If you have a self-oscillating converter, which seems like you are talking about, note the regen to the point of oscillation is at the oscillator's frequency. That's not going to do a thing on the signal frequency, and it's not going to do a thing on the IF frequency. A mixer by definition has a different frequency on the input from the output, which does not make for proper regeneration.

Unless they were modified, most BC-453's were used in multiple conversion schemes. Either tapped into the 455KHz IF of an existing receiver (and if the existing receiver was single conversion, leaving its image problem intact), or as a tuneable receiver with some sort of converter ahead of it. The better ones used two stages of conversion, to get around the image problem that arose with a high signal frequency dropping immediately down to 455KHz.

Tim Wescott (tim@seemywebsite.com) writes:

> I've seen designs in old handbooks that used regeneration in the RF stage to sharpen up the response there -- that would, indeed, help the image rejection at the expense of intermodulation performance.
>

That was a weird period, because it seemed to only exist after there were single conversion receivers with IFs in the HF range, and then disappeared somewhat later.

Indeed, it seemed to all be tracked to a receiver using a 7360 as the mixer, and I can't remember whether the Q-multiplier was in that famous article in QST by Squires circa 1963 (and if so, it would have been in that famous Squires-Sanders receiver of the same period), or if the construction article in QST that seemed based on the Squires article introduced it.

So for almost the next decade, others would put that front end q-multiplier in their single conversion receivers with the 7360 mixer (and there was even a mosfet based version).

The secondary articles were clearly doing it because the first article did.

But I've always wondered about the first article. Since yes, the receiver used a tuned circuit into a mixer, so the receiver did lack front end selectivity. But, the mixer was about the best for the time, and the IF was in the HF range. So it was far less likely to overload than many mixers of the period, and image rejection was easy with the high IF.

Later, the notion of high IFs became more common, and nobody particularly worried about image rejection, even though they too were using single tuned circuits into the mixer.

So did Goodman toss in the front end Q-multiplier because of a perceived or real need for extra front end selectivity? Or did he simply want to play with the concept?

What never made sense was that he went for the front end q-multiplier with it's added tube and added ability to overload, when any other receiver would have simply added better front end selectivity.

Well, is the regeneration feeding back energy at IF or at RF?

It is feeding back IF energy into the grid where also the RF signal is applied

Agreed. In fact I am looking for extra selectivity in terms of image rejection, not in terms of smaller channel bandwidth. The BC-453 selectivity is enough for me!

There is no need to push the regenerative converter into oscillation for the purpose of generating the beat note. I can easily get the beat note from the BC-453 built-in BFO.

As I wrote in my initial post, I am supposing to have a separate local oscillator that feeds the conversion frequency into the converter stage. Therefore the converter is not a self-oscillating one. Nevertheless the converter is regenerative because its plate coil is linked to its grid coil, so that it would tend to self-oscillate if one does not properly control the cathode resistance. Such circuit is called Q-dyne, see QST 1938

I know, but my purpose was to get good image rejection with just a single stage (too easy with two!) and I was wondering whether the Q-dyne approach would do the job.

I think the worst case I ever got was a Racal RA-17 that had all the
capacitors cut out because someone thought they might contain PCB
contaminated oil. That took a lot of hours going over the schematic
and any pictures I could get to put it together again.

Pretty fuzzy now, but I did see a couple of commercial fishing vessels with
converted BC-375's (could have been 191's) that were xtal controlled on the
old "AM" marine bands. New data plate on front from some company in Seattle,
Washington. I cannot be sure at all, now, but I always assumed the
commercial modification (I assume FCC approved) was an added 6L6 oscillator
built into the tuning unit, with another control or two and crystal socket
sticking out the front of the tuner box. That was really a long time ago,
and I was pretty green around commercial gear.
Old Chief Lynn, W7LTQ

The BC-453 was used to sharpen IF selectivity on superheterodyne receivers by tuning around the passband of the ~455 "kc" IF frequencies. It was known as a "Q-Fiver," and added a second conversion stage down to the 85 kc IF of the command set. Why not play with regeneration at the BC-453 IF level, if you think you need it? (The regeneration scheme works--I used it on several old receivers, and a WW II tank transceiver.)

If you are worried about Images with your mixer scheme, you may want to look into some RF selection/amplification before the mixer. Back in the Fifties and Sixties, one-tube PreSelector projects were popular, (several good receivers, such as the Drake 2B, had them built in). The extra tuned circuit should reduce your image.

--W9NPI

Antonio Vernucci wrote:

> I would like to build an old-style receiver using a BC-453 stuck at 500-kHz as IF chain. A possibility would be to put a pentode in front of the BC-453 mixing the incoming RF signal with the signal generated by a variable local oscillator (VFO). To improve selectivity, one could adopt a regenerative arrangement whereby part of the pentode plate signal is fed back into the grid (by inductive coupling), and the cathode resistor is then adjusted just before the tube starts oscillating. In other words, a kind of Q-multiplying converter (I think this is called "Q-dyne" receiver). What I am not fully sure about is if the increased selectivity I so obtain turns into a higher rejection of the image frequency, or just into a narrowing of the received bandwidth (which is already narrowed down by the tight BC-453 85-kHz IF transformers). My feeling is that said regenerative scheme would offer no advantage in terms of image rejection, but I would value very much your opinion on that subject.

Sorry, Smokey. So far as I know, you're about 30 years too late. You can check Detroit's Best Suburb (Chicago) or Cleveland, or do the swaps. Next one up is the L'Anse Cruse on December 2. Or drop in on one of the local clubs. HPARC(.org) has its next meeting on Nov. 14. Check out the DART repeater on 146.64.

 I am seeking cooperator, part-time job and gaining much profits.
We are from China. And our business is internation trade by internet
for many years. Our products is best selling in Europe. And Our
products have Top quality.
Now we are seeking cooperators in Europe. If you do this business, you
will gain eur1000 to eur3000 per month.
We provide products and pay shipping cost. It is easy, and you do it
only by internet.
This is a opporunity. Please contact me if you have any question, we
can talking for detail.

According to site http://www.qsl.net/wd4nka/TEXTS/qdynef.htm , the regenerative converter should improve image rejection (while channel selectivity is left to the BC-453 narrow IF).

I am going to build it and see how it behaves.

Tony, I'm anxious to hear your results! My own gut feeling is that there could be a small improvement in image rejection, but not enough to make a big difference. Don't let anyone keep you from trying, we all have our thoughts, but only a firsthand account will mean much.

Looks like others have covered most of the bases. I tried using a BC-453 with it's 85khz IF as a sharply selective IF strip for a home brew, single conversion front end. (for CW, of course). Anyhow, the selectivity goal was met OK, but I had never thought how much trouble it would be to design a local oscillator (for the home brew front end's converter) that would keep the signal in the new, terribly selective IF band pass. On a crowded band, I was forever losing my contact when it was my turn to listen. Either my contact had drifted away, or my receiver had drifted too far for me to find him in the howling jungle.

Filter caps are always questionable. You can measure them for shorts before applying power. Also, inspect them visually, any cap with indications of leakage or bulging should be replaced before applying power.

Another good precaution is to bring the equipment up on a variable transformer like a Variac. I have a metered Variac which will indicate a high current condition quickly enough to prevent burning out power transformers but a non

metered one will do. Even through the filiments may not be
fully powered up the rectifier will still pass enough
current to indicate bad caps.

Despite their bad reputation electrolytic caps are
pretty long lived, even when not powered up. An electrolytic
depends on having voltage across it to maintain the thin
film which forms on electrode. The film will disappear given
long enough without the voltage but it may take many years.
The film will usually re-form after voltage is applied.

My first transmitter was a BC-375-E which I had modified to work with an external exciter. I used it on AM with a preamplifier to allow using a dynamic mic instead of the carbon mic the input stage was designed for. I even had this thing on sideband using a Barker and Williamson SSB generator and some self bias for the amplifier stage. Probaby the only Class-A linear on the air but it worked. Mostly, I used it for CW where it worked very well.

The exciter was completely home built using an electron coupled oscillator circuit copied from a General Radio frequency meter. Given a reasonable warmup it was very stable.

I still have this rig in storage but its too large for my current situation.

SALUTE, Richard!
      You really took that great rig for a ride! Mine was also a BC-375E, I
did try the T-17 microphone once with a guy using a NBFM adapter, and he
reported me working just as well on AM as NBFM! (or maybe phase modulation?
who could tell the difference?) CW was best, especially when one could get
the antenna to load where you could hardly find the plate "dip" anymore, and
looong dashes caused the graphite plate to glow a little red! Wow!

Old Chief Lynn, W7LTQ

Thanks Richard. This is a 12 volt radio, Drake's first solid state
product apparently.   I'll run it up on a variac just in case. Don't
relish the prospect of tracking down a toasted transistor, since I'm
more familiar with tube circuits, so I'll try to err on the side of
caution.
    Cheers,
    Nelson

There is a decent parts store on Ford and Newburgh roads in Westland.
"Electronic Connection" I believe. No BA stuff, but lots of what Radio Shack carried back in the day.
Bob

Thanks Bob for the recommendation! When you live someplace like me that is
remote and have regular sorties into a city like Detroit it is refreshing
even to find a parts store.

I'll certainly check it out.

Thanks again!

> I have my Hammarlund HQ-170 receiver running in the garage. I noticed something that I cannot explain and thought someone here might be able to shed some light on the subject.
>
> So, I'm listening to some operators talking and all is well when some noise (scratching, like electrical noise) starts and gradually gets louder in the audio. If I turn my florescent overhead light off, the noise goes away and all is quiet and easy on the ears. Turn the light back on, and all is good. After a while, could be 2 - 15 minutes, the noise comes back. Again, turning on or off ANY light in the garage will immediately kill the noise and all is well again. Let me repeat. Turn ON or OFF ANY light in the garage will immediately kill the noise. Now, I could see the florescent light causing the problem by having it on, but what gives on actually making the noise go away? Is this something with the radio? Is there something I can do to remedy this? Why is this happening?

I came across a similar problem and thought I traced it to my wife's older sewing machine's foot control. However, I discovered it was actually the power bar feeding the machine, and the power switch in the power bar. Since there did not seem to be anyting obviously wrong with the switch, I finally solved the noise by adding two 'Y' caps, one from line to neutral after of the switch and one across the switch. A second power bar of the same model exhibits similar effects.

Neil S.

Well, I just got three different brands of schedule 40, and one brand of schedule 30, microwaved them and then put them on a bridge with a 20W transmitter on 10M as a source (figuring 10M propagation is so lousy it won't interfere with anyone), and I see no signs of leakage.

So maybe I'm full of it. Or maybe my information was really old.

>I guess the big question is what makes the tubing white? If it is
>something like zinc oxide, perhaps that is what is causing the concern?

That may well have been the case. I do know that slate and gypsum have also been used as PVC fillers, though neither one is conductive.

But I don't see any sign of it actually happening today with modern PVC in spite of what happened in the seventies.

At least two BC-191/375s made it into the movies....

In the classic John Wayne "Island In The Sky", it's the main transmitter in a transport plane downed in the snowy reaches of northern Canada during WW2. You also see a BC-348 and a Gibson Girl in action.

In the original "Manchurian Candidate", during the climactic scenes where Laurence Harvey goes to the unused spotlight room during the convention, there's a BC-191/375 used as a prop in the room. No connection to the story at all. The set dresser probably thought it looked enough like PA equipment to pass muster.

--

The original "Flight of the Phoenix" shows an ART-13 but it is not used in the story.

I can get both the 7 pin and 8 oun ACSY (Japanese version pf the DIN) from

Kenwood. But I think these are the female as a local bought one a few years ago and it was a replacement part not the matching male ACSY. Kenwood will only tell me they have the part number(s) in stock.

W6XA tells me I can use a regular 8 pin DIN but don't want to do that as I might damage the TS-130.

Thanks to all.

filling in holes, and trying to keep body and soul together on a starvation diet. The two men who had traveled from Kiev with me were very dissimilar. Jakob was a nasty-minded man who rushed to the guards with any tale he could trump up. Jozef was different altogether and could be relied upon to "pull his weight". Because my legs were bad and made it difficult for me to stand for long, I was given the job of sitting by the side of the road breaking stones. Apparently it was not considered that my damaged left arm and barely healed ribs and lungs were any drawback. For a month I stuck at it, slaving away for my food only. Even the women who worked were paid two zloty for each cubic yard of stone they broke. At the end of the month I collapsed, coughing blood. Jozef came to my aid as I lay by the roadside, ignoring the command of the guards. One of the soldiers raised his rifle and shot Jozef through the neck fortunately missing any vital part. We lay by the side of the road together until a farmer came by in his horse-drawn cart. A guard stopped him and we were tumbled roughly on top of his load of flax. The guard jumped up beside him, and we trundled off to the prison hospital. For weeks I lay on the wooden planks that served as my bed, then the prison doctor said that I would have to be moved out. I was dying, he said, and he would get into trouble if any more prisoners died that month, he had exceeded his quota!

There was an unusual consultation in my hospital cell. The prison Governor, the doctor, and a senior guard. "You will have to go to Stryj," said the Governor. "Things

Hebrew tale?
Write it down, Lobsang, and write also of what could be,
in Tibet!"
    A Rabbi, famed for his learning and his wit, was once

asked why he so often illustrated a great truth by telling a simple story. "That," said the wise Rabbi, "can best be illustrated by a parable! A parable about Parable. There was a time when Truth went among people unadorned, as naked as Truth. Whoever saw Truth turned away in fear or in shame because they could not face him. Truth wandered among the peoples of the Earth, unwelcome, rebuffed, and unwanted. One day, friendless and alone, he met Parable strolling happily along, dressed in fine and many colored clothes. 'Truth, why are you so sad, so miserable?' asked Parable, with a cheerful smile. 'Because I am so old and so ugly that people avoid me,' said Truth, dourly. 'Nonsense!' laughed Parable. 'That is not why people avoid you. Borrow some of my clothes, go among people and see what happens.' So Truth donned some of Parable's lovely garments, and wherever he now went he was welcome

Just to add this thought to the thread.
Yes; but isn't that the black stuff that contains carbon or something?
Read somewhere that some other colours of 'plastic' pipe are Ok for
coil forms because they, unlike the 'black'' do NOT contain conductive
substances such as carbon-black. But as said that is only hearsay. And
when I say 'black pipe' I may be referring to ABS plumbing! Comment or
contradiction is invited.

Yes; starting with Cyrus Fields original telegraph cable in the 1850s! But they were really very heavily constructed 'armoured cables' with a single central conductor for sending slow speed DC pulses (telegraph) across the Atlantic.
In deep water the cable was not as heavily armoured as inshore and on the fishing banks where cable damage due to ice, fishing and during the Cold War possibly sabotage, was more likely.
Lived here since the 1950s when the first Transatlantic Telephone cable went into service. It used 24 voice channels on two separate cables; one east-west, other west-east.
They were definitely coaxial cables with around 800 volts +ve and 800 volts -ve fed from the two ends (Newfoundland-Scotland) to power the underwater repeaters. I have short piece of the inner core of the cable somewhere!
Within a couple of years the older telegraph cables were discontinued. One of the 24 voice channels equipped with VFCT (multi tone) could carry more two way telegraph traffic than all the previous DC cables.
But yes, to stay on topic, definitely coaxial cables.

FS: Alpha 77D Mint Condition!!!!!!
This Alpha has new front and side panels. New front panel says 77SX,
But its the 77D, This is a later model 77D and the later Peter Dahl
power transformer. So if you buy the kit they sell online, you can add
and have two 3cx1500a7 tubes inline.
I have a spare tube 3cx1500a7 full output which will go with this
sale. Not only is this a BEAUTY!!! But also works like NEW!!!!!!!!!
Nothing wrong with it at all.  4500.00 Pick up NJ

The marauder is Ok on SSB but its not designed for AM (as is the Drake T4 series). Not many rigs have high level AM and good SSB. I think the Apache and SB-10 is a better bet as the best rig is the Viking + Viking SSB adapter which is RARE.

What sort of connector is it? Is it a locking DIN? Is it a locking DIN that screws down or just screws in partially?

I corresponded w/ the OP in other NGs and direct. It's a Kenwood TS130S. The "ACSY" or "REMOTE" (depending on where you're reading) connector is a circular 7-pin DIN. The "REMOTE VFO" connector is a circular 8-pin DIN connector (with one pin offset from the generic type). I've seen them offered for sale for ridiculous prices -- I easily modified generic (and inexpensive) plugs to fit.

73,
Bryan WA7PRC

There are actually a couple different 8-pin DIN connectors, just as there
are three different 5-pin DIN connectors.  You should be able to get the
less common ones from Connector World Supply if you can actually find the
DIN spec numbers for them and if you do not require locking or Tuchel types.

```

The annual HCRA auction will be held this coming Friday, November 2nd, in Feeding Hills, MA.

The auction is open to everyone and admission is free. We typically have over 100 people in attendance and a good time is always had by all.

If you would like to sell your items the rules are very simple:

1. Amateur radio or computer equipment only.
2. No CRT monitors please, we are not in the disposal business.
3. 10% of the selling price goes to the club, up to a maximum of $10. This means that any item selling for more than $100 you still only donate $10 to the HCRA.
4. Mark your items with your name, call (if you have one) and a minimum bid (if you want to).

The rest is up to us. We will endeavor to get as much as possible for the fine quality equipment you have brought. Depending on the turnout and time allotment the auctioneers reserve the right to combine small items into groups to move the auction along more quickly.

If you are a buyer all you need do is show up by 7:30 and have fun!

If you have some stuff you're too embarrassed to put your name on why not donate them to HCRA? We will happily get what we can for them and the money goes to help fund the auction for the following year!

In addition to the auction we have a great raffle going on. First prize in the raffle is a $250 gift certificate to HRO. Tickets are a $1 each or a book of 6 for $5.

Adding to the fun is coffee, donuts, soda and the best time ever for a Friday night. Stop paying those inflated eBay prices for ham radio 'stuff'. See it, smell it, touch it and buy it at the HCRA auction at a far better value.

Setup for the auction starts at 6:30 PM and the bidding starts at 7:30 PM. Sellers will not be allowed into the auction hall prior to this time so the chairs and tables can be set. Items will be auctioned off in the order received.

For more information including directions please visit:
http://www.hcra.org/auction_2005.htm

The auction is held at:

Feeding Hills Congregational Church
21 N. Westfield Street
Feeding Hills, MA 01030

For more information please contact:

Jim Mullen, KK1W
413-235-3228
kk1w@arrl.net

'73... and see you Friday,

Jim, KK1W

I'm not the OP (original poster) -- I replied w/ info.  As he intends to
interface a linear amplifier, he needs a nonlocking 7-pin plug such as:
http://search.digikey.com/scripts/DkSearch/dksus.dll?Detail?name=CP-1070-ND.

Its a 7 pin ACSY. I have not tried to plug anything into the male plug and have no experience with a TS-130S. It is the remote connector plug shown on page 5 of the manual. Don't know what all the locking etc means as no experience with this type of special Japanese connector at all!

A fellow from Avvid tells me the Kenwood part number is E07-0851-05 but a Kenwood search comes up not found. I sent them an e-mail

If it's 7 pin it's E07-0751-05. I just checked at the website I gave you and both 0751 and 0851 are valid part numbers. Make sure you entered them correctly.

I'm looking on ebay for a D-104 microphone to use with my Heath Marauder
transmitter, and I need to make sure I get the right one.

There seems to be differences between models... some are amplified, some
are not; some are high impedance, and some are low.

The sellers for these mics are highly unlikely to know anything worth
knowing about them it seems... so, which one do I need for my Marauder and
how do I make sure I'm getting the right one?

Thanks...

The Heath Marauder normally accepts a high-Z mic, something at or above
a nominal 8-10k Ohms. A non-amplified D-104 will do the trick, nicely.
You may, however, also use an amplified D-104 by setting the gain of the
mic and the transmitter such that it does not flat-top (overmodulate),
as observed on a 'scope. I use both models but prefer the standard
model for the likes of older Johnson-Viking and Hallicrafters
transmitters. My take on the issue.

OK guys heres a question for you.
What's the oldest coax you've got.
I found a piece today in the shop that a friend,
KN4R had given me years ago and I had forgotten about.
It's Amphenol RG8/U and it's dated June 1944.
That's pretty old for coax. I'll have to go
to some of my old ARRL handbooks and see when
the first ads for coax showed up.
Has anyone else seen any coax older than this?
Does anyone know when it was first introduced?

From http://www.britannica.com/eb/topic-123218/coaxial-cable
```

coaxial cable, which first gained widespread use during World War II

From
http://searchdatacenter.techtarget.com/sDefinition/0,,sid80_gci211806,00.html

Coaxial cable was invented in 1929 and first used commercially in 1941. AT&T established its first cross-continental coaxial transmission system in 1940.

But   http://en.wikipedia.org/wiki/Coaxial_Cable
sez
a.. 1880 - Coaxial cable patented in England by Oliver Heaviside, patent no. 1,407.
a.. 1884 - Coaxial cable patented in Germany by Ernst Werner von Siemens, but with no known application. [citation needed]
a.. 1894 - Oliver Lodge demonstrates waveguide transmission at the Royal Institution. Nikola Tesla receives U.S. Patent 0,514,167 , Electrical Conductor, on February 6.
a.. 1929 - First modern coaxial cable patented by Lloyd Espenschied and Herman Affel of AT&T's Bell Telephone Laboratories, U.S. Patent 1,835,031 .

It's a German connector. DIN stands for German Industry Standard. And yes, I think the connector you want _is_ a standard DIN type, just not a very common one.

Some of the DIN connectors have a locking collar on them to lock them into place, and there are several variants of these. One is an actual DIN standard one is a Tuchel company type, and the other I'm not really sure about. You clearly don't have any of these, otherwise you'd know it.

>A fellow from Avvid tells me the Kenwood part number is E07-0851-05 but a

What you need is a standard number or a manufacturer's number. If you call Connector World Supply in Seattle and send them a photo, they may be able to match it for you. They are good folks at tracking down oddities.

And some of the high-Z ones have crystal elements, while others have dynamic alements with step-up transformers.

>The sellers for these mics are highly unlikely to know anything worth
>knowing about them it seems... so, which one do I need for my Marauder and
>how do I make sure I'm getting the right one?

You need a high-Z unbalanced input. You do not want a crystal element
mike, because the elements fail and cannot easily be replaced. Beyond
that, there are a bunch of variants that will work fine.

That beat my 1957/58 run (I think that is Belden real RG-8/U) -- still works
well (swept it a couple of years ago --actually was a bit better than some
of the stuff they sell today)

Thanks to all for your help with the D-104 question.

I hear you about the crystal elements... I have had a few D-104's back in
the day, and I remember that the crystal elements were somewhat subject to
failure (although, even so, they seemed to hold up pretty well).

A half hour or so ago I bought a D-104 on ebay for $40, so we'll see
what happens when I pick it up and actually plug it in. The seller is
just a few towns over from me so I'm going to go pick it up tomorrow night.

Hopefully it'll work and be a nice addition to my fledgling boat anchor
station (see my page on qrz.com...).

The DIN specification is German in origin. The "circular DIN" connector can include a locking tab, ring, or no locking mechanism. You don't need any lock.

If you absolutely MUST have the Kenwood part, Burghardt (http://www.burghardt-amateur.com/Burghardt/HTML/new_product_frames/new_text_frame.html) shows them available...

7 pin PN E07-0751-05 = $5.99 ea
8 pin PN E07-0851-05 = $6.49 ea

You want the 7-pin to interface to your amplifier -- the 8-pin is used to interface to a remote VFO. DigiKey has the generic plugs available:
http://search.digikey.com/scripts/DkSearch/dksus.dll?Detail?name=CP-1070-ND
(7-pin, $1.32 ea)
http://search.digikey.com/scripts/DkSearch/dksus.dll?Detail?name=CP-1080-ND
(8-pin, $1.35 ea)
If needed, it's super easy to "nudge" a pin with heat from your soldering pencil.

You didn't mention what amplifier you'll be using... be aware you may need to be concerned about ALC threshold. If you don't use ALC, just keep an eye on your monitor oscilloscope.

Hmmmm. Crystal elements are, as pointed out, subject to failure
arguably far more frequently than dynamic and other types. I continue to
have good success with crystal D-104's, albeit I do take care of them.
Suitable replacement elements are still available at reasonable cost and
D-104's can sound very good on vintage AM gear. If the mic is purported
to work, the mic head and UG or TUG stand are in observably nice
physical condition, the price you paid is quite reasonable. If it turns
out the element is defective, and onsidering the cost of a replacement
element, you'll still be OK... and, have a "new" mic.

Its the stuff that has turned the center dielectric dark that is said to be unusable. It has a "contaminating jacket" and it spoils the center conductor insulation. Its been a while since I've seen that kind of RG-8 and 11, though..... Looking at some vintage Handbooks, it looks like they use a balanced output in the tx projects up until about 1950 or 51.
  The output networks appear to change over to an unbalanced output about those years. I do note that some late 40's handbooks with balanced outputs indicate the output is to be connected to a "tuner". Still, most of the tuner projects also appear to address either long wire or parallel feeders for the output. Finally, I see some ads in QST, etc. for 25' and 50' rolls of surplus coax in the late 40's. de Jeep/K3HVG

Where are they available? The last I heard, CAD/Astatic was replacing the crystal elements with dynamic ones if they came in for repair, claiming they couldn't make the original crystal any more.

The crystal itself is sealed with a flexible goo... as long as that stays sealed, it's fine, but as soon as it develops a small crack, atmospheric moisture gets in.

It's not a matter of the pins not being in the right place, they are physically larger on some of the generic replacements. When forced into the Kenwood socket the phenolic breaks and allows the pins to short.

If buying generics look closely at the pins size. They should look skinny. I don't know how else to describe it unless you want a measurement of the pin size. Ok 0.0585.

OK... I probably should have been a bit more clear when I spoke of
replacements. What I meant was a crystal or dynamic element that would
fit the D-104. Your comments about the old Rochelle salt mic elements
are, of course, entirely correct. For further amplification of my post,
  I just bought a couple of crystal elements from Mouser to replace an
element in a D-104 and a 10D head. They appear to work OK with adequate
output and good frequency response, especially given the usage on AM.
They are not original nor as big ones as in the original D-104 but with

```
a fabricated adaptor ring, they are good to go (and inexpensive!).

I had no idea anyone was still making them!  I'll check out the Mouser
catalogue just for grins!  Thanks!

Scott, The Mouser p/n for the best one that they have is 25LM025. There
are others in that particular group, though, both ceramic and crystal.
Again, you can't beat the price.....!

Well... spit.... that one is now out of stock. The one above it doesn't
have quite the high freq response but works fine, too. I use both.
Don't know why they don't have both in stock. But... 10kHz is certainly
high enough freq response for tx audio, don't you think?

   Also in higher priced receivers like the SP-600-JX and
51-J series, they work quite well for CW. The original idea
was patented by James Lamb around 1935 and applied first in
National Co's receivers, for instance the famous HRO. A
later version was patented by Hammarlund (can't remember the
inventor's name) and used in their receivers (Super-Pro 100,
200, 400 and others) and some others. The filter in Collins
receivers is of this type. The Hammarlund version allowed a
wider range of bandwidth and also adjustment of the notch
```

without changing the center frequency. Hallicrafters applied the Lamb type to all their receivers with an X in the type number, i.e., SX-28. Earlier crystals were often mounted between clamps as in the Hammarlund Super-Pro, later versions were in standard type crystal cases like this one. Single crystal filters do not have very good skirt selectivity and were supplanted by various types of multiple-pole IF filters when methods of producing these at reasonable prices were developed, and T-type notch filters operating at the RF frequencies.

The crystal has slightly different characteristics from those designed mostly for use in oscillators.

I don't know what Hallicrafter's receivers this crystal fits but there is likely someone out there with a receiver that needs the crystal.

     It may not be that easy. While some rx were built so
that a crystal filter could be added it was usually in the
form of a kit or assembled filter with suitable punch outs
on the panel and chassis. The early Hammarlund Super-Pro was
like this, one could order a crystal filter _assembly_ to
retrofit a receiver without one.
     Also, the IF frequency of the S-9/SX-9 was 465 Khz, a
common IF frequency at the time. Until about the mid 1940's
there really was no standardization of IF frequencies,
common ones were 455khz, 456khz, 462khz, 465khz, 172khz (the
last mostly in automobile receivers), and some others.

Generic circular DIN plugs fit and have have been working fine for me two
decades on both my TS120S and TS130S rigs, interfaced w/ a VFO120, SM220 and
Heath SB220.  With the exception of the difference in the easily correctable
pin location, there have been zero issues.

I'd really like a copy of the user manual, but if that does not materialise,
anyone know the operation of the FR50B?

This is what I THINK it is:

It's a double conversion reciever thus:

```
\|/RFin > RF AMP>----> 1st MIX >---- >5173.9 Khz FILTER> -->
                                     |
                             L.Osc (VFO)

>---------------------- >2nd >----->455 Khz FILTER
                           MIX
                            |
                HETERODYNE OSC (5628.9 Khz)
```

1st IF = 5173.9 Khz
2nd IF = 455 Khz

It's the frequencies that I'm after for each band. To work them out I need
the mixing details.

I think the mixing details are:

```
80 and 40m: 1st IF = L.O - RF in
                   2nd IF = HET OSC - 1st IF

20.40.12.10m: 1st IF = RF in - L.O.
                   2nd IF = HET OSC - 1st IF
```

Can anyone please confirm this? TIA.

Use an alligator jumper to mark the connection point of the old cap.  This
has saved me numerous times.

Yeah, the thing about ceramic and crystal mikes is that they all have all
sorts of wacky peaks and dips within the voice passband... the response
is very ragged and that results in the characteristic sound of the mike.
Even if you chop off everything outside of 300 to 4000 Hz, you can still
tell a dynamic D104 from a crystal one.

I discovered that any of the flat "Domino" style caps with Micamold stamped on them are best replaced.

A while back I was able to pickup a clean D-104 at a garage sale from
a guy that called it a "chicken choker". Anyway I got it for $20.00
and it had the amplifier in the bottom of the stand. I removed all the
amplifier and rewired the terminal strip in the bottom. Put on new mic
cable and wired it into my Johnson Ranger. It works like a champ. I
get good audio reports with it.

WOW, someone knows what a Mackay 3010 receiver is. I used to work on
those years ago when I worked in Marine Electronics. The 3010 was
replaced by the 3020. The 3010 was an excellent CW receiver. They were
pretty reliable but not the easiest receiver to work on. I hated that
dial tape assembly. Dont remember too much about it. You can always
call/email one of the Mackay radio service depots (several around the
US port cities) and someone may still have an old 3010 book or it
maybe included in one of the old Mackay MRU console books. Good luck
on that.

According to my 1948 edition of _The Antenna Manual_ by Woodrow Smith (Editors and Engineers) the change was made in 1944 so this coax may still be good. He describes the new dielectric as being light gray in color. You would have to measure the stuff to be sure.

My impression is that open wire lines were used up to the time when television interference became a problem, say around the early 1950's.

Hi,

I would like to do some soldering on my Scott tube amp and would like
to know how to do it safely. Is there a way to discharge the stored
electricity.

Thank You, Chris

Newly listed on eBay. One of Hammarlunds last receivers, but solid state.
Same conversion & filters as Collins S-Line.

I would test them before use. These are mostly stacks of mica dielectric and aluminum foil electrodes rather than plated "silver mica" types. Mostly, they were use for high voltage transmitter circuits. They do not have the stability and very low leakage of the plated type but were useful for HV bypass use. I think they may suffer from the same problems with degradation of the bakelite shell that other caps seem to have. Also, the fact is that most of these caps are getting to be very old.

Fiber washers are also common in consumer grade vintage Philco radios.
Mostly they are missing but are present in un molested units.

They surve no eletrical or electronic fuction. They seem to be there for a
physical mechanical and or acousital reason.

This may help. I bet it may be mentioned in the RCA Radiotron book. I'll
look next time I am in the shop.

Speakers in metal boxes are prone to resonate somewhere. I would be willing to bet 5 cents that the reason they are there is to prevent unwanted resonances.

Regarding the speaker common lead, it is common to avoid a common ground, which could cause ground loop problems (hum). Usually, the manufacturer knows best and all you need to do is put it back to the way the engineers had it in the first place, and it will work as it was supposed to.

It may well be alignment. Those 60 kcs IF's must be in alignment per the manual or it will seem too narrow. Do that after checking the tubes in the IF area (My experience is with the HQ-170 and HC-10).

The 60Kcs IF set the filter alignment for all of the selections (500hz, 1, 2, and 3 as I recall) double those values when switched to AM.

Hope you have the alignment part of the manual.

If that does not work check resistances and voltages.

Thanks Colin, unfortunately ones gets boatanchor gear, as in this case,
where it is not as the manufacturer supplied it. The speaker had been
replaced and if the fibre washers had related to an electrical purpose,
an earth wire might have been relevant. I know than normally speaker
connections do not need to be earthed anywhere, but in the 2-B the
chassis is marked "spkr" and "earth".

This particular set also arrived with the 15 & 10 metre bands dead and
the problem was that the Xtal coil adjustment on 10m was way out -

people do fiddle when they don't know the consequences.

Simon

I have a somewhat-odd request:

I am looking for color-matched knobs, banana jacks, binding-posts, banana plugs, etc. Matching colored wires would be really cool too.

Having at least eight distinct colors available would be really nice. I know that last one is difficult because I'm a very typical male who cannot name more than four different colors off the top of his head. But I have no problem looking at any color-coded resistor and having the value and tolerance immediately register in big shining numbers in my brain, so I don't think the problem is my eyes, I think it's just that I'm male :-).

I believe that HH Smith etc. used to do stuff like this and while they're still around I don't see any colors but red and black in their catalog.

Looking in the Digikey catalog they list "Emerson"/"Johnson" as the maker of some banana plugs and jacks available in ten colors. If I could get matching colored knobs and maybe even test lead wire, I would be so so happy.

Any leads (including just "how to paint random knobs in matching colors") would be greatly appreciated.

In case nobody else has figured it out yet, this is for a super-duper bench tube tester that currently is just a bunch of stuff scattered across my bench but which in my head I could turn into one mega-super tube tester/curve tracer. Black would of course be ground, and I suppose the two filaments should be green, and maybe the cathode can be black, but I still need three other colors (plate, grid, screen) and at the moment can only name two, so seeing a catalog page with a color-coded lineup of everything would so make my vision come true! Many decades ago I saw a picture in a magazine of what to my juvenile eyes looked like what must be the ultimate tube tester of all time, and while I do not remember the model or make I do clearly remember row after row of gleaming colored knobs and jacks. Does this description ring a bell with anyone?

Tim.

I believe Kilo sells anodized knobs in a few different colors, still, and
that Pomona Electronics should have a few colors of banana jack.

>Any leads (including just "how to paint random knobs in matching

Go to the auto parts store and get cans of automotive lacquer. It gives
a nice even finish on generic aluminum knobs and comes in more colors
than you can imagine.

Filaments are brown. Red is plate. Grid and screen are orange and
yellow but I forget which is which. There's a RETMA standard for all
this stuff somewhere.

AES, http://www.tubesandmore.com/, has knobs in 8 colors. Click on "Knobs" in the left hand column. In the next screen click on "Chicken Head".

I've never seen test lead wire in more than 4 colors. If you can use ordinary wire, colors shouldn't be a problem.

I have seen test wire in more than 4 colors. It is actually in the Belden catalog I have -- BUT the minimum order (in feet/spool) for any color other than red or black is high (at least 1000 feet, as I remember)

It does look cool when properly set-up. Old EF Johnson and HH Smith banana jacks did have several colors. Needs any in blue? I have several panel mount banana jacks in that color.

Hello,

I recently found this great transmitter, and went to great lengths to get it out from the back of a huge old warehouse.

Unfortunately, the manual seems scarce.

I would like to buy, borrow, copy, etc.. the manual so I can fix the set. Usually a manual wouldn't be strictly necessary, but the set is difficult to service since when you slide any of the drawers out, it's instantly disconnected from the frame wiring! ha!

(Anyone got a "service cable" for it? Other owners of the URT-12?)

So, if anyone is kind enough to make available a manual I would appreciate it greatly.

Pictures of the set (I have not had time to clean the cabinet, sorry) are here:

http://www.bunkerofdoom.com/mil/urt12/index.html

I think it's a good piece of Coast Guard history, I'd like to restore it. - and get it on the air!

Thank you,

Patrick Jankowiak

Not really (the one at the local Radio Shack (way in the back in 1970-something when I was getting an old Hallicrafters up and running) was more boring - blue and white with brown sockets and black knobs, as I recall), but I suspect that certain auction sites probably have exactly the thing you were looking at available from time to time. All the other old junque shows up there.

Not to deny you the joy of building, or anything like that - but if it was made, there are probably examples out ion the wild to buy, if you look for them.

Nortex Electronics
In Memory of Lewis E. Cearly Jr., Proprietor
Lewis Cearley, 84, passed away Friday, Oct. 5, 2007, at a local hospital. Funeral: 1:30 p.m. Tuesday in Greenwood Chapel. Interment: Greenwood Memorial Park. Visitation: 6 to 8 p.m. Monday at Greenwood Funeral Home. Pallbearers: Gordon Callaway, Ed Forrester, Bob Martin, Ken McAllister, Mike Stroud, Jimmy Waters. Honorary pallbearers: Bob Carr, Bryan Goulette, Perry Hale, Steve Haney, Jerry McKinney, Robert Plum, Pete Pratt, Mark Rosso. Lewis was born July 21, 1923, to Lewis E. Cearley and Ina Carson Cearley in Childress. His family moved to Fort Worth in 1936. He graduated from Tech High School and joined the Navy in 1942. He served on the aircraft carrier, Tulagi, in the South Pacific, participating in three invasions, plus always dodging the kamikaze. Lewis enjoyed participating in squadron reunions. Lewis developed an intense interest in electronics at an early age; for example, he wired an entire house when he was 14. He started the Cearley Co. on Pennsylvania Avenue in 1954. In 1976, he established Nortex Electronics on West Vickery Boulevard, passing out advice, spare parts and good cheer until a month before his death. Lewis and Joy Cearley were married in 1967, putting an end to his happy bachelor days. They celebrated their 40th anniversary on Aug. 12, 2007. His stepson, John Watson, died in 2001. Survivors: Wife, Joy; sister, Sylvia Cearley of Fort Worth; stepdaughter, Kay Haddaway and husband, Richard of Santa Fe; stepdaughter-in-law, Brenda Watson of College Station; stepgrandsons, James Haddaway and wife, Shannon of Fort Worth, Keith Watson of College Station; stepgranddaughter, Dr. Kimberly Hill and husband, Jeff of Georgetown; and stepgreat-grandchildren, George Haddaway, Vivian Haddaway, Ethan Hill and Avery Hill. Published in the Star-Telegram on 10/7/2007.
Lewis was a great friend to many electroncs and photography enthusiasts and is sorely missed. Lewis was my very good friend. During the week of Monday OCT 15 through Saturday OCT 20, 2007, the store will be open to the public to make any final purchases.
It is strongly recommended to do so, as after this, the store will be closed and all goods will be recycled.
NOTE: Thursday-Saturday of the above week is a special and very final "garage sale" also open to the public.

I'm very sorry to read this sad news.I had the pleasure of meeting
Lewis a few years ago when I came over to Dallas, with some other
Brits,  for the Microwave Update convention. Kent Britain, WA5VJB,
drove a few of us around the area all day, calling in at various
surplus stores, one of them being Nortex. I was really amazed at the
stuff Lewis had there! There's nothing like it over here in the UK.

At that time Lewis told me he was considerng selling the business but
I guess he didn't after all.

If anyone over there in in contact with  his family please pass along
our sincere condolences, not only from myself but from the other Gs
who met him that day... ie G6GXK, G3PYB, G4DDK, G8UBN and myself,
G3PHO

There is a working TMC SSB converter on eBay, item# 250174034634. It is a
TMC CV-1722 which is the CV-591 with TMC updates, including the temperature
compensated carrier oscillator deck. This is listed by a friend of mine.
Check it out if you have been looking for a CV-591.
Larry

>
> Not really (the one at the local Radio Shack (way in the back in 1970-something when I was getting an old Hallicrafters up and running) was more boring - blue and white with brown sockets and black knobs, as I recall), but I suspect that certain auction sites probably have exactly the thing you were looking at available from time to time. All the other old junque shows up there.
>
> Not to deny you the joy of building, or anything like that - but if it was made, there are probably examples out ion the wild to buy, if you look for them.

In fact, following the lead of Alan Douglas, I think in my head the unit I had seen in a picture was the Weston CA-1630. Nice pic here:

http://www.tubedepot.com/tt-ca-1630.html

At circa $5000 I think I'll have to pass, but it's a beaut.

I think in my mind I want even more color matching than in the original - I just see black and red binding posts there, in my head the posts should match the knob should match the element. So it looks like the decades have elaborated the original, to the point where I desire something more than the original :-).

Like Scott Dorsey suggested, probably the way for me to go is to get 5 or 6 or 7 different color banana jacks and paint the knobs to match, as it seems increasingly unlikely I'll get much match in "raw" knob color, but still thanks to the others who posted about the multi-color chickenheads available from AES (I had actually bought them in the past!) and the knobs from Small Bear.

Tim.

Actually - it's all ten of the "standard" color code colors - I have a
couple of the kits... for a project "someday".

best regards...

Actually, ten colors available! 0-9 is ten, not nine. Sometimes I fall
into FORTRAN mode too so I won't blame you for being off by one :-).

I don't know if the Pomona parts are 100% identical, but I just
ordered a few sets from Digikey sold under the "Emerson/Johnson" name.
I'm guessing they're all made in China by the same company:

  http://dkc3.digikey.com/PDF/T073/P0372.pdf

Using color-coded Banana plugs/jacks seems preferable to having
massive crossbar wiring, at least in my head.

Question for anyone who has used the Weston CA-1630: Am I correct that
there are pushbuttons in many of the knobs and this is somehow related
to either removing the function of the knob (pin selection) or

selecting that knob's function for stepping during curve tracing
(grid, plate, screen)?

Really wonderful link to a big pic (may not work!) showing the CA-1630
set up to test a 300B:

  http://us.st11.yimg.com/us.st.yimg.com/I/yhst-8476489043850_1968_29319026

With wonderful toys like this available, made in China, the lead content should be checked!
Please, please do not put them in your mouth.

Hey, I grew up holding 60/40 solder in my mouth while plugging
krypton-85 filled regulator tubes in my left hand and turning knobs
just inches away from radium-filled meters with my right hand. None of
it made in china. And I'm perfectly normal!

Joking aside, it's pretty obvious that a test set with 1000V B+
running around obviously won't be in my kids' hands much less in their
mouths.

Tim.

For Sale: Two CDE AR-22 Rotors with Control Boxes that need some minor work.
I will sell them for $45 each.
The controls light up and the motors on both rotors work. Operation is
intermittent. They probably need cleaning and
lubed and maybe the caps changed in the control boxes. They look very nice
and have all mounting hardware including
the lower masts attachments. Also included are the manuals. Shipping is
extra. Thanks, Charlie Hugg, K5MBX

I suspect the lead content on them is much lower than it should be.  The
Chinese are not exactly big into making quality phosphor bronze and most
of these sorts of parts coming from China tend to be made from cheap and
gummy cartridge brass.  That's okay for the socket, not so good for the plug.

What was the name? Do you have any other info to go on? Maybe others still living - who your family can contact from that list - might be able to provide additional clues - like the area they were from. Undoubtedly, that would give you a "call" area to look under as well as any name.

W5YI insists they can do some searches, not sure if they can go that far back.

What makes you think he was a ham?

After all, the greeting was used on the wired telegraph system. For
that matter, likely it carried over to commercial radiotelegraphy.

That doesn't mean anything, except that they may never had a ham
license.

Excellent condition?  You say that with a straight face?

With some work it probably can be.

Yep, that's a VERY subjective statment.
I've seen POS sets that were only a front panel, no cabinet,
no tubes, with caked on dirt and crap, and it
be described as being in "Excellent, Original condition".
Yeah right...

I am in the process of recapping one of my receivers that uses many 0.05 MFD paper caps. Since 0.05s are not READILY available, I am split equally on the following:

1. Do I recap using the more readily available 0.047 MFD caps even though they are of less capacity than the original?   OR...

2. Do I recap by paralleling readily available 0.022 and 0.033 for a total capacity of 0.055 MFD?

If I do the 0.047 replacement I am violating the rule I have had beaten in to me about NEVER allow a capacitor to be of LESS capacity...but when they are higher it is OK. However 0.047 MF is only 0.003 MFD off the target 0.05 MFD value whereas the "safer" higher parallel combination (0.055 MFD) is 0.005 MFD higher than the target capacity.

Thoughts? My receiver uses a lot of the 0.05s so it is not like I only have one or two to consider.

Thanks for any help.

Gary

Gary,
Personal opinion here... I wouldn't hesitate for a heartbeat
to put in the .047s. They're well within the manufacturer's margin
of error in any case. And single .047s are much cheaper and
better looking than a bunch of paralleled caps.
Also... personal opinion as well, I've intentionally used much
smaller caps than OEM in some circuit locations, such as line
bypasses.
Cheers,
Nelson

I agree... There is absolutely no reason not to use .047's.

I third the motion. You can actually calculate the needed capacity in any particular circuit, whether it be bypassing or coupling. The chance that any particular .05ufd capacitor originally used by the reeceiver manufacturer would be the calculated value is about as as slim as finding a nice SX-88 at a landfill. Ballpark is close enough, unless it is in a tuned circuit.

And, the capacitors usually have a tolerance far greater than the .03 ufd difference.

Use the .047 and do not give it another thought.

73, Colin K7FM

3000 pF isn't going to make much difference in a .05 mFd bypass. You can get the .05 values from NTE if you feel the need to keep it original. JustRadios.com probably has them too. Personally, I'd use the best quality axial lead yellow jackets I could find.
If you really want to keep it original, consider restuffing the old cardboard shells from the wax caps to preserve the under chassis appearance.

Pete

Note that some of these WILL be in tuned circuits, and you'll almost certainly need to realign the receiver with a sweep generator afterward. But that is not a bad thing.

> And, the capacitors usually have a tolerance far greater than the .03 ufd difference.

Yes, figure 20% tolerances on those things.

> Use the .047 and do not give it another thought.

If you really worry, you can get .05 uF orange drops.

I am looking for a clean FLdx-400 transmitter. I am willing to pay a reasonable price. I would also like a to buy an FTdx-400 transceiver. Please advise me what you have. I am not a dealer nor do I resell the items. These are for me to use on the air.

This comming Sunday...
The Seasons Last...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 21st 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

One more thought Gary,
You can look at the application and determine what the purpose of the
capacitor is, the approximate frequency, and the Xc of the capacitor
at that frequency. For instance, it it is in the IF amplifier stage,
you know that the frequency is 455KHz, and can calculate Xc. From
that, you can determine what range of values makes sense to replace
into the radio.
That said, remember that those paper capacitors had values given at
+/-20% tolerance. So why do you have a rule beat into you that you
never replace a capacitor with a value less than the original?

I just re-capped a Hallicrafters S-53A. The paper capacitors are ALL rated at 600V. However, many of them are in low voltage applications, and never see more that 30 volts accross them. Why put in a HUGE paper capacitor? Because it was cheaper for the company to stock just one part type and use it wherever a .01uF capacitor was needed.

So it is OK to question why a given component is where it is, and make a judgement call on what would be a good replacement.

Also, as I replace the paper capacitors, I like to wear gloves. The wax is kind of nasty to get on you.

Have fun, and good luck,
Gary

FS: CDE Model 44 rotor and control box. Good project.
The control unit lights up and works but the rotor will start to turn and then stop. Motor does work though, probably needs cleaning and lubed. Price is $75 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

Hey, whaddya mean?!?

http://www.antiqueradio.org/dumpster.htm

:-)

Phil Nelson
Phil's Old Radios
http://antiqueradio.org/html

P.S. I agree with other responders that the .047 is a fine replacement.
Since the old caps were manufactured to such a wide tolerance, your modern

replacements may be closer to the specified value than most of the originals!

And, Phil's website is as good and concise as it gets about replacing capacitors. See http://antiqueradio.org/recap.htm

Even if you have been doing it for years, you will appreciate Phil's nice writing style and useful information.

And, a big fat A for taking the time to help spread his wisdom, learned from years of experience.

Even after years of repairing radios, we learn that we can do it better. A few years ago I was going to replace a paper cap in a 17 tube receiver. I do them one at a time. I clipped the old one out, got a phone call and dinner call and shut the soldering iron off and left. I was not able to return to the work for about a month. By then, I knew there was a capacitor out - but I had clipped the old leads off and it took me an hour of tracing and schematic reading before I could determine where the missing capacitor was. Now, I am more methodical and make notes before I clip the capacitor. A notebook and pencil are always nearby to document before I start work. Life has been much simpler since then. And, it really is a good idea to test the radio after a maximum number of changes.

Colin K7FM

Keep a cheap set of imported clip leads handy. Place a set over the snipped
leads to "remind" where the old part was snipped from.

Digital photos of sections of the under chassis are also great visual
reminders.

"Keep a cheap set of imported clip leads handy. Place a set over the snipped leads to "remind" where the old part was snipped from."

Great Idea. Why didn't I think of that. Now I will be able to keep repairing radios clear into senility.

Thanks, Colin K7FM

Working or repairable to power a TR-4C.
Have a couple Heath HP-23's but a bit light or reduce output--can do
if..need.
tnx AL   k2erg@arrl.net

Colin has it right. I had a similar experience. Ever since, I keep a
digital camera close and take close-up pictures as the work
progresses. I can always check my work, and I have a set of pictures
afterwards to show off.
I also keep a scratch copy of the radio manual's component list and

schematic that I mark up during the job. When I hand the radio over to
the owner, I can show him exactly what I did to restore the radio.

Rick,

I found an even better place...

DH Electronics in Wichita. Kansas.316 684-0050.
VERY EASY TO TO BUSINESS WITH! Complete inventory and very, very reasonable!
Also the best deal going on can rebuilds.
Dave is his name.

Smokey

I have not received anything on this list since 9/17/07
Also, I have changed ISP's, and now use cable broadband.

Consider this just a test.

I will add to what is on this page that the flat molded caps are often also mica types, however, they are not silvered micas. They are simply stacks of alternating mica dielectric and foil plates. They are not as reliable or high performance as silvered micas and should be checked. These were used mostly in high voltage applications or where waxed paper had too much loss.

Black Beauty caps are not exactly paper dielectric but used paper impregnated with a polyester. They _should_ have been low loss and quite reliable but became notorious within a few years of their manufacture for developing high losses. I suspect this may have been due to some problem with the molded casing because Sprague sold capacotors with a similar construction but in dipped epoxy casing as Orange Drops and I have not heard that they shared the same short life problems.

BTW, while silvered mica caps are generally very reliable they can still go bad. I've had to replace quite a few in rebuilding a couple of SP-600-JX's due to instability. Here again all were molded bakelite cases so I suspect either the case or perhaps end connections. Again, the dipped epoxy mica caps do not seem to suffer from this problem.

Every ham should have the chance to browse through a store like Nortex. It was literally one of those hole-in-the-wall places; it was off the beaten track just enough that you'd never find it by chance. I don't know if he ever advertised the place, but if you tinkered with electronics in Fort Worth long enough you were bound to hear of the place. I worked at the Fort Worth Museum of Science and History during the 1980s and I have absolutely no doubt in my mind that we bought some stuff from Nortex; a lot of the equipment and parts for sale there simply could not be found anyplace else.

One ENTIRE WALL was filled with vacuum tubes. Most of them were still in the little cardboard boxes. I don't think he had anything in there younger than 10 years old bare minimum; much of it no doubt older than me. Lots and lots of Tektronix oscilloscope modules and microwave stuff; carbon-comp resistors; old VTRs from local TV stations; 16mm film projectors; plenty of old books and magazines. Plenty of sockets, connectors, plugs, cables. And let us not forget panel meters! Plenty of knobs, transformers, inductors.

And probably more junk video monitors of various types in one place, at least above the surface of the ground.

Yes, indeed, it was great fun to prowl through. I'm gonna miss it. Last time I was there was about eight months ago and the poor gentleman looked to be in very sad shape even then. My thanks to him for supplying local hams with a fun place to hunt for parts and whatnot.

73,

Matt J. McCullar, KJ5BA
Arlington, TX

"Matt J. McCullar" (mccullar@flash.net) writes:

> Every ham should have the chance to browse through a store like Nortex. It was literally one of those hole-in-the-wall places; it was off the beaten track just enough that you'd never find it by chance. I don't know if he ever advertised the place, but if you tinkered with electronics in Fort Worth long enough you were bound to hear of the place.

I wonder how common that experience was?

When I was a kid, about 1974, about three years after I first went into an electronic store (it was Etco Electronics here in Montreal, which did mail order so maybe some remember it), I heard from two very different people about some store where "you can buy a handful of resistors for 5cents" or words to that effect. Both people spoke of it in legendary terms, and had yet to visit it so they'd heard of it from someone else.

I went with one of them, and it was like a supermarket, complete with baskets at the door. A mixture of industrial surplus and components for tv and radio repair.

It's also the only local place remaining from back then, the only place still with wooden floors and like the old school of electronic store.

And any time someone asks about getting components in the local newsgroup, invariably someone mentions the place, far ahead of the fancier electronic distributors that have risen up in more recent years (and actually which have been around for decades at this point, but never match the feel of those old stores).

Michael VE2BVW

Does anyone on the group have the schematic for the 34 optional calibrator?
Picure of the unit would be nice also.

Tnx,

Dale W4OP

In Seattle, it was Nuclear Electronics, run by Jeff Atwood... with LOTS of neat-o antique/surplus "junque". It was worth the long bicycle ride for this teenage kid who was a new ham!

Yes, the flat molded micas are starting to show their age. Although generally more reliable than paper, I have found some bad ones in recent 1940s TV projects.

When in doubt, check 'em!

I read somewhere else that the plastic casing in Black Beauties, etc., developed microscopic cracks and admitted water vapor over the years, causing the same problems as in paper caps.

Phil Nelson

Anyone have a copy of the magazine article (73?) that is purported to have modifications for the Heathkit HR-10B ham band receiver? While in Boston, I picked up one of these little green guys at the MIT monthly ham flea market this weekend and before I go through the radio, I'd like to get my ducks in a row, modification-wise.
thanks
Bob

I just acquired one today& the meter light is burned out.

Before I pull the cover, has someone replaced that bulb before?

If so, is a replacement locally available)RS) and do I solderit  in?
line?

Thanks!

But which article?  The one in 1967, which was the "Canadian Issue" so it
must have been July?  That one was written by a Canadian, and I can't remember
what was in there.

There was also one in the November 1972 issue of 73, again I can't remember
what was in there.

I also think there might have been a brief bit somewhere along the way, of
a power supply modification, but that might have been in one of the major
articles.

I can picture both articles as having a few mods each, but I may
be mixing them up.  Somewhere in one of them was a bit about improving
the selectivity, which is the most specific detail I remember.

I rescued a hammarlund HQ-180 from the scrap pile. The front panel is
a little rusty but overall
not too bad a condition. The chassis seems to have some kind of very
thick greasy scum on it.
It does not appear to be tobacco smoke but a clear substance. I'll
have to experiment and see
what will remove it.

That may be, they certainly develop very large cracks sometimes. I've disected a few BBs. The capacitor itself was distorted, oddly flattened rather than being tubular. Perhaps they were wound this way or perhaps some sort of differential shrinkage of the encapsulation pushed them out of shape. They were _supposed_ to be very long life, low leakage, deluxe capacitors and are generally found in high quality equipment.

I think the designers were using the best materials & technology available at the time. And they never imagined that people might be using or restoring these devices several decades beyond their expected service life. Most radios were considered appliances. Contemporary electronics, even cars for that matter, are not designed to remain in use forever. I remember when my Dad bought a Mercury in 1965, his one and only new car. What would the salesman have said if Dad had asked how that car might be running some 40-odd years later? Dad is still alive, bless his heart, but the car perished decades ago.

:-)

Phil Nelson

> That may be, they certainly develop very large cracks sometimes. I've disected a few BBs. The capacitor itself was distorted, oddly flattened rather than being tubular. Perhaps they were wound this way or perhaps some sort of differential shrinkage of the encapsulation pushed them out of shape. They were _supposed_ to be very long life, low leakage, deluxe capacitors and are generally found in high quality equipment.

My memory is that the problems with the BBs began showing up pretty soon after manufacture. For instance, Hammarlund used them in SP-600 receivers made in the mid 1950's but the military was replacing them in mass with disc ceramics by the late 1950's, so something must have changed pretty rapidly. However, they were still being advertised in the early 1960's so, perhaps, the problem was cured and it was only the early versions that were bad.

Hallo , good Morning

I try, one schematic of single TX homebrew only valves for
7 / 14 / 21 / 28 MHz for CW with VFO (Osc/mix/VFO/pre-final/
final) con tube 807 with final P.A. someone, indicates to me where I
to find one schematic.

Tnx Radiovintage

I have "some" parts for older equipment (ham/cb/2way) and even came into some "boatanchors" - inquire with needs. Not all is listed on web site - too much to list! Trying to clear stuff out. Monthly specials also available while they last. If I don't "have" what you need - I can check my resources to try to "find" what you need.

www.clfurlongenterprises.com

Thanks for reading - this is a one time post - unless replying to someone's request.

Might be decades of cooking grease, who knows. Start with paint thinner (mineral spirits) and a soft, lint-free cloth. Denatured alcohol or even lacquer thinner if that doesn't work. Q-tips to clean up nooks and crannies. Don't get any moisture into places where it doesn't belong. Denatured alcohol will leave no residue. Keep solvents away from dial markings & any other painted stuff.

Whatever happens, don't run the chassis through the dishwasher, as some crackpots do :-)

Phil Nelson wrote:

> I think the designers were using the best materials & technology available at the time. And they never imagined that people might be using or restoring these devices several decades beyond their expected service life. Most radios were considered appliances. Contemporary electronics, even cars for that matter, are not designed to remain in use forever. I remember when my Dad bought a Mercury in 1965, his one and only new car. What would the salesman have said if Dad had asked how that car might be running some 40-odd years later? Dad is still alive, bless his heart, but the car perished decades ago.

My Mom still drives a '68 Rambler, and my Dad drove a '65 Dodge Dart up until he died a couple of years ago. The car is still on the road.

I have paper copies (notes and some copies) of the HR-10B modifications
that you are asking about -- but have not found an Internet source.
Many of these are marginal to bad.
The voltage regulator tube mod for regulation of the VFO voltage
is probably the most popular.

Why modify it? It's a 40 year old entry level radio. Why try and make it
into something it was never meant to be? I respectfully suggest that you
just restore it to operational condition and enjoy it for what it is.

I may have to agree with Billy about not modifying the rig. I say "may" because I'm not aware of the mods listed - or how they might improve the radio if any. NOR have I heard of any rigs having been done - and any results.

Mods "can" be nice - if they "enhance" a radio's performance. However - most of the mods I see - tend to turn a radio to crap - more often than not. I've done some myself - and well - though I know they were done correctly - lets face it - the radio worked better as it was "intended" and it didn't take me long to put it back to normal. Then I've seen still other's that flat out made radios sound like pure garbage.

But in the grand scheme of things - based on my own experiences and not knowing the end results of said mods -I'm inclined to agree with Billy - retore it as it was meant to be - and enjoy the "relic" of the past. Besides, if you go to sell it again, it seems to me, it would fetch more - restored OR "original" - than butchered up.

Just my 2 cents.

I just recalled a few radios (transmitter/receiver/transceiver) - I was asked to "undo". One of which was a Drake. Though the work - "seemed" to be done "neatly" - it turned the rig into a pile of dung. The owner paid one guy to modify it - paid me to "un" modify it. Just goes to show - they're not always what they're cracked up to be/do.

The ACSY connector is used in place of the normal 8 pin DIN.

Anyone have a source?

I got one at swapmeet with a problem. It works fine on the Short side
but on the Open side on check the eye stays open instead of being
closed. The wiring and tube seem OK. The schematic I have shows a 5mmf
cap across the osc coil but I don't see one and wonder if it was missing
from the factory because the parts list doesn't show a 5mmf cap. I'm
guessing the coil came with both caps as an assembly or my unit is a
later one and they may have figured out a way to wind the coil where
they don't need it. Anyone know? Scoping the grid I can see a flash of
high freq. osc momentarily but that's switching in the Short side.
tnx

The manual I have for the CT-1 shows a 10 pf capacitor across the oscillator coil, however, it's not in the parts list either. The oscillator coil must have come from the factory assembled with a tuning capacitor that made the circuit oscillate at the correct frequency.
Do you have a complete manual that gives the circuit theory of operation? That section describes both open and short checks as well as normal operation. If not, I can send you a PDF of the manual.

Cheers!!!

Dave
Thanks for the offer but I have a manual copy that seems to be god
enough..
I'm hoping some one who sees the post and has a CT-1 has the time to
take a look inside to see if there;s really a 5 mmf cap across the coil.
Right now I'm trying to recall what junkbox of my many might have one..

No joy... neither of them has any 40-uf 450-volt electrolytics in stock.
Both of them say mid-December which usually means "at the earliest".

I know I can build what I need out of different values in series-parallel
but I'd rather save that as a last resort.

I also tried searching for values from 20 uf up to 80 uf at 450 to 600

```
volts and no luck.

Yeah, unfortunately not this time... no stock on anything from 20 to 50 uf
and 450 to 600 volts.  Best guess on delivery is mid December, which
almost always means "at the earliest".

In this case the small axial-lead tubulars is what I need.

Their tubular axial leads aren't bad, though... I just found some 47-uf
450-volt axials for $2.81 each vs. $10 - $16 for Mouser and Digikey (the
ones of which they have no stock).

Henry, I just opened mine and it has a 10pF NPO ceramic across the end of the coil opposite the green dot [the left end looking from the rear]. The frequency of the oscillation in not as critical as it operating over the range of loads, so I should try 10pF and see how it works with a variety of capacitor values under test. If it craps out at either end of the load range, try 5, 15 or 20pF and see how it goes.

Hi Neil
Mine has the 10mmf  on the end opposite the green dot..
But my schematic shows a 5mmf across the big coil which mine doesn't
have..
Does yours have a 5 mmf on the coil as shown on the schematic and in
Fig. 3 page 11?
tnx
Hank

```

The CT-1 uses an oscillator tuned to approximately 19 MHz for the open test. It does not matter if it is 21 MHz or 17 MHz, and there will be no difference between a 5 pf or a 10 pf or no pf across the coil.

If no one got offended, I would say that you are barking up the wrong tree. But, I do not want to hurt anyone's feelings, so I will not say that. My dog would not get her feelings hurt if I talked like that to her, but people do.

The problem is elsewhere.

One of the problems, when you pick up something that does not work, is assuming that it ever worked. Sometimes kits were assembled, and did not work, then put on the shelf where they languished for decades.

Check the wiring and check to see if the oscillator is oscillating. Sometimes switch contacts are wired incorectly. Sometimes switches are improperly cleaned then fail Sometimes resistors fail.

In the past, we check the paper and electrolytic caps. Now, we may need to check the mica caps.

Colin K7FM

I second the vote for www.justradios.com.

David provides excellent service, lightning fast shipment and capacitors are fresh. I've recapped many radios with his caps and you can;t go wrong.

Smokey

good statement - don't assume it ever worked - at one time I made my spare change fixing kits that the purchasers couldn't assemble correctly.

That is useful information, Tim, thank you!

Chuck Harris wrote:

> The usual causes of short life

Thank you, Chuck. The existing tantalums in the receiver lived for about 25 years so I guess that's not considered "short life". The one that failed did so in a rather startling way. Scared the bejeezus out of me when it exploded and let loose a bunch of smoke.

I guess if I get 25 years out of it's replacement I'll be happy..

I have a friend, a retired lawyer who once worked for McGraw-Hill. He
does not normally read the newsgroups but I sent him the google link to
this thread, and he emailed me back his response. Here it is:

"Mr. Ludwig is absolutely correct when he says that the large concerns have many lawyers and paralegals on staff who are solely devoted to tracking down infringing parties. Much of that activity stems from the fact that U.S. copyright law and legal precedent demands that the holders of copyright defend their properties vigorously or risk loss of the copyright.

So, if an infringement is discovered, the identified infringer will be sent a C & D letter, even if the material in question is of little immediate value to the holder. The C & D letter costs the holder very little to send, and will at least establish some diligence on the part of the copyright holder to assert and protect the holder's copyright of the material. Most of the time, the infringer takes steps to stop the infringement upon receipt of the letter, and that's the end of that. It is situations where the infringer does not act-ignores the C & D letter-where the decision of what to do next becomes dicey.

If the material is an original, artistic work, then the publisher who holds copyright will most likely go ahead with a lawsuit, because there is at least some possibility that the work will continue to be enjoyed by a significant number of people far into the future.

However, in the case of old, outdated reference material, there is likely going to be some sort of a value test done before the holder will go further. In a perfect world, the holder would take whatever action is necessary to stop infringement in every single instance, but the world we live in is one that is driven by economics and practicality. If the materials in question are non-artistic, antiquated, and out-of-print, the up-front costs of securing a judgement against an infringer will likely exceed the value of the item being infringed. Although there are mechanisms to recover some of these costs from an infringing party that chooses to ignore a C & D letter, the reality is that recovery of these costs in the short term is often quite difficult, and often difficult in the longer term as well. The holder may well find that they have spent all this money to pursue an infringer who has no assets that can be attached. The phrase "you can't squeeze blood from a stone" really applies here. It is for this reason that casual copyright infringement, which occurs millions of times per day on the internet, is rarely prosecuted.

With regards to Mr Jute, his interpretation of the strength of Australian copyright law, as it applies in the USA, is quite fanciful, to say the least. If you are going to prosecute an infringer in an American court, the law that is going to referenced in that case is American law, period. Australian law will only be considered to the extent that it matches the American statutes exactly. If the publication dates stated previously are correct, then the "RDH4" publication that is being discussed here had a USA copyright period of 28 years before entering public domain UNLESS the holder took explicit legal steps to extend the period another 28 years (later expanded to 65 years and modified again to 70 years beyond the author's death). No extension, no protection now for works produced in that era. In the case of a reference work such as the "RDH4" the question of whether or not the copyright was extended is FAR from certain. There are many that were extended and many more that were not. If the person who is publishing it on the internet has not received a C&D letter within a few weeks or months, I would suspect that the "RDH4" is indeed public domain at this point, but I would not be certain.

Now, a publisher might choose to pursue litigation in an Australian court, and might get a judgement there, but all of the same issues of recouping the costs outlined above come into play, and if the infringer is located in some other place than Australia the difficulty of recouping those costs take on a whole new dimension."

So, there you have it....An opinion from someone who has been there, done that.

-Scott

I have a nice HQ-180A with a problem. The 455 kHz IF is
too narrow. There appears to be some regeneration going
on because the gain also appears to be too high. Unfortunately,
the component density is not conducive to just randomly
replacing parts. Has anyone else had this problem? Any
ideas greatfully appreciated.

73, Roger

You haven't read the threads, Scott. We are not at the moment talking about US copyright but about the thieves Gregg, Tim Williams and Choky Prodanovic who claim that their lies about Canadaian copyright protects their theft of the RDH4. Last time I heard, Canada was not yet a State in United States of America.

As I have already pointed out to the permanently irrelevant Flipper, it is a particularly American arrogance to assume when someone shouts "Stop, thief!" that all Americans should instantly call their attorneys to start blowing smoke to cover their guilt.

I'll see you when I start on the US copyright thieves. Meanwhile, if you want to play, raise your eyes to the horizon.

Andre Jute
Hell, these days even Chinese smoke is superior to made-in-the-USA smoke

Hello Roger:

I expect the selectivity is too narrow because of the regeneration.
Regeneration also increases the gain.   It may need to be realigned
according to the manual - but I would not do that until you find the cause

of the regeneration.

It could be a tube, but more likely it is a defective bypass - either in the plate/screen leads to the if stage or the grid bypass. Since all of these caps are ceramic disc caps, they should still be good.

Start with the simple stuff and measure the voltage and resistance as specified in the manual, on the if stages.

Remember to find the problem before alignment.

Colin K7FM

Hello,
I see there is a TMC-591 - CV-1722 SSB Converter currently on eBay
(250174034634)
Does anyone know the specs on the CV-1722? I know TMC made updates all along
the production period, but haven't found anything specific to the CV-1722.
Thanks for your help.   Larry

They are for all intent and purposes the same. TMC issued updates - 4 or 5 IIRC - during the production runs - many of which were made to units as they either went through depot level maintenance - or in the field by a tech who would decide to install it on their own. AFAIK other than the mods - the only difference between th cv-591 and the cv-1722 is the production contracts (dates).

We've lost the case to our CV-89A - (the part the "drawer" slides out of, not the rack for the three units). Apparently sometime during a move or such, we've managed to "loose" the case. We still have the "drawer" and the filter unit that it plugs into; just the case (with fan) is missing. Anyone have a "spare" - or a complete unit for sale?

Thanks.

Hi all. I have a 45 that is one of the old hallicrafters. Wonder what this record is worth? If anyone has an idea, or could give me a ball park figure, please e-mail back. Don't check the news group that much. Thanks from Dana in Griffin, Georgia.

Does anyone in this group have a Hallicrafters SX-43 or SX-42 that
still has the cardstock cover over the tuning access holes on the

bottom?? I am looking for a photo of the cover marking to create a properly marked replica.

Thanks,
Neil S.

I checked mine and the schematic does not show any cap across the
'large' coil, nor is there one. You might check the cathode for
oscillation activity since virtually any capacitance across the
secondary will kill the oscillation [even a 'scope probe]. There is
not a whole lot in there to go wrong, so you might check the eye tube
triode for emission; if it is weak that could be a problem, or if it
has been inactive for a long time. Mine has not been used since I
refurbished it 10 or so years ago, and it worked immediately I turned
it on and the tube warmed up.

Neil S.

For Sale: ME-26D/U VTVM. This is the military version of the HP410B. All functions work. The only problem I had with it was a broken connection to the capacitor in the AC probe. This is a little "button" capacitor with a threaded spindle and the threaded spindle separated from the body. I soldered it back together and it works fine now. Includes probes and an original shipping box (serial numbers for unit and shipping box do not match, though).

http://www.knology.net/~thelanding/ME-26DU/Front.jpg
http://www.knology.net/~thelanding/ME-26DU/BackOpen.jpg

http://www.knology.net/~thelanding/ME-26DU/Top.jpg
http://www.knology.net/~thelanding/ME-26DU/Accs.jpg
http://www.knology.net/~thelanding/ME-26DU/Manual.jpg

Note that the manual is for an ME-26B/U. The "A" model was the HP410B, but the B, C, and D models utilize a different cabinet design and different meter movement.

Asking $40 plus shipping from 35824.

Thanks,

Barry - N4BUQ

Hi Al,

I used to sell them at Amateur Radio Supply (Seattle) in the mid 70s, when I was young & foolish. I'm not so young now (but still foolish). 8-)
A Cinch-Jones #P-310-AB is a 10 pin (male, chassis-mount) connector but you specified you need 12 pins. The part numbering scheme for Jones connectors is:
P = male pins, S = female pins
3/4nn = series and number of pins
AB = chassis mount
CCT = cable mount

Much more info about is here: http://www.tresco.com/

73,
Bryan WA7PRC

Hi

I have recently acquired a 2B receiver and its 2BQ multiplier. The latter was missing all mounting screws and had a replacement speaker fitted. I note the manual refers to fitting fibre washers behind the 2BQ front grille when attaching it to the cabinet.

Can anyone advise me whether the earth speaker lead should be earthed to
the 2BQ cabinet? Likewise what purpose do the fibre washers serve? The
2BQ chassis seems to be earthed via the coax to the 2B and electrically
attached to the front grille, so that the sheet metal screws themselves
would electrically connect it to the cabinet albeit not very well,
whether or not fibre washers were used.

Thanks

Simon VK2UA

Ward - Google reveals
Fair Radio Manuals URL:
http://www.fairradio.com/catalog.php?mode=view&categoryid=211

MM-CU-52   -   Maintenance Manual CU-52 Antenna Coupler original
$15.00 each

And another site URL:
http://r-390a.net/Pearls/antennas.pdf

Sez
"CU-52/URR allows up to 10 receivers (unbalanced ant input) or 5 receivers
(balanced ant input) with minimum of interaction"

AND Also Sez

"Date: Fri, 4 Nov 2005 14:17:11 -0800 (PST)

From: Steve Hound <radiohound2@yahoo.com>

Subject: [R-390] CU-52 Multicoupler

Can anyone tell me where the CU-52 multicoupler was used? Unit uses plug in

coils and covers approximately 100KHZ - 22 MHZ. Uses 6BA6 tubes and has

both balanced and unbalanced output (has at least 5 outputs - don't have in
front

of me right now). Came to me in heavy wooden box (should say boxes - have 4 units) and only a few of the plug in coils. The coils fit into a 5 pin socket and look

easy to duplicate. Any help would be appreciated thanks Ward"

Sounds like your post maybe

Good Luck

Lamont

I have for sale an RME-69 receiver with the matching speaker and the

matching converter (5 and 10m). The receiver is fine working order.
I've never powered up the converter.

The price is $450 + shipping from zip code 26033.

Drop me a line for further details.

Dave Heil K8MN

This comes down to, "We stole it so often, it is now ours."

When will you write to the Newnes imprint of Reed-Elseviers, Bratzi,
to dob in that little list of copyright thieves?
<c>Reed Educational and Professional Publishing Ltd 1997

What can be settled by writing to Thomson who have nothing to do with
the RDH4 copright? The thief Bret Ludwig is blowing smoke in our
faces. If you want to know why, come follow the threads on RAT.

> If you don't have the .pdf, you might want to download it now.

And you will be a thief if you do. Bret Ludwig is a confessed thief
and a pimp for thieves.

Andre Jute

You are quite a character! You claim the book is owned by Newnes yet
you claim it was stolen from YOU. Your "facts" just do not add up.

If it was indeed copyright the owner would have removed it by now (if
they even cared).

Very precisely.

Companies like Newnes guard their property very well. They have full time infringement monitoring and attorneys on retainer in every country in the world worth bothering with. Anyone doubting that need only put up a scanned book that IS copyright and they will find out.

The book is a work for hire from a company that no longer exists in any tangible form. Like most of the classic RCA and GE tube manuals and educational materials published before about 1962-64 the copyright was not renewed at the time and because of US law and laws elsewhere is effectively out of copyright. Andre's opinions not withstanding are irrelevant.

The fact that the book was reprinted is irrelevant. In fact, I suspect Newnes never would have bothered reprinting it if it were subject to copyright. It is very difficult for third parties to license old books in most cases because tracking down everyone is a hassle and because most publishing houses in New York refuse to talk to anyone without a lot of money-they just can't be bothered.

Andre(w) is a liar, a mountebank, and a shithead. It's likely he molests koala bears and craps in his neighbors' hydrangea bushes as well, but this as yet unproven.

So, he camps with Arny. It also explains the state
of Arny's bushes. And they are brown bears, not Koalas.

```

Hi guys!

Part of my boatanchor collection, too many radios now and too little space. All collector quality and working! Serious collector Dx-er and shortwave enthusiast, now I've decided to slim down to just my Hammarlunds, would love to get my hands on a collector-quality HQ-180!!!

So here goes what I've got before I put them up on Ebay!

National NC-183D with matching speaker.
National NC-173
National NC-88
Hallicrafters S-53A

All are working, some have SAMS and all have been checked out / tweaked by a life long Ham & electrical engineer...

email me for questions, pics, interest, and thanks for taking you time to look. If you love the warm glow of vacuum tubes, the whistle of tuning in shortwave at night you might give one of these guys a good home!

P.S. Location, Grand Canyon State

```

On Oct 5, 7:34 pm, Bret Ludwig <bretld...@yahoo.com> wrote:

> > You are quite a character! You claim the book is owned by Newnes yet
> > you claim it was stolen from YOU. Your "facts" just do not add up.
>

> > If it was indeed copyright the owner would have removed it by now (if they even cared).
>
> Very precisely.

This is the same old story twice: "We stole it so often, it is now ours."

Then the thief Bret Ludwig, who has never seen the inside of a publisher and never will, sets himself up as an "expert" on publishing house practice, starting with a paranoid daydream absolutely typical of his fascist mentality:

> Companies like Newnes guard their property very well. They have full time infringement monitoring and attorneys on retainer in every country in the world worth bothering with. Anyone doubting that need only put up a scanned book that IS copyright and they will find out.

Actually, small publishing houses, and large ones, have rather small staffs fully occupied with editing and selling books. Copyright infringement in a civilized society is so rare, and the sort of concerted theft that the thief Bret Ludwig pimps for so very rare, that nobody pays much attention to copyright theft, not even the rights manager, whose function is to license rights to other territories, for translation, and for other media, not in the first instance to enforce copyright compliance.

> The book is a work for hire from a company

That's a lie. It has been explained again and again that this is an Australian book and that Australian books created by employees are protected *everywhere in the world* for the life of the author plus 70 full years.

> that no longer exists in any tangible form.

This is an implied lie: Bratzi tries to claim the property dies with the property owner. Actually, the copyright survives to to the full term and may be, and in this case was, transferred to a new owner:
<c>Reed Educational and Professional Publishing Ltd 1997

>Like most of the classic RCA and GE tube manuals and educational materials published before about 1962-64 the copyright was not renewed at the time and because of US law and laws elsewhere is effectively out of copyright.

This is a whole bunch of lies and ignorant statements compounded. For a start, we're not talking about the US, we're talking about the thieves Gregg, Tim Williams and Choky Prodanovic who stole in Canada the RDH4, and claim the protection of Canadian law (which they deliberately lie about) for their theft. I'll get to the USA thefts later if their posters don't in the meanwhile take them down.

> Andre's opinions not withstanding are irrelevant.

This is a double negative from a semi-literate solder sniffer trying to sound sophisticated. What do you mean to say, Bratzi?

Surely, since I am the only one here who actually knows anything about copyright, courtesy of having earned my living by copyright for half a century, my knowledge and opinions are the most relevant?

> The fact that the book was reprinted is irrelevant. In fact, I suspect Newnes never would have bothered reprinting it if it were subject to copyright.

Holy Moses! And this scumball Bret Ludwig holds himself up as a copyright expert! Yo, moron, Newnes reprinted exactly *because* they owned the copyright:
<c>Reed Educational and Professional Publishing Ltd 1997

>It is very difficult for third parties to license old books in most cases because tracking down everyone is a hassle

For you, the thief Bret Ludwig, of course it is impossible, because you don't know who to approach and how to approach them. Newnes and other publishers do this every day for a living. For them it is no bother at all.

But, in any event "license" in your mouth is a lie. You're not on about licensing copyright for payment, you're just a thief and a pimp for thieves, in this case the thieves Gregg, Tim Williams and Choky Prodanovic, and their mirrors.

>and because most publishing houses in New York refuse to talk to anyone without a lot of money-they just can't be bothered.

Yet another lie. Most copyright licensing deals are for a few thousand dollars. Many, many translation rights, especially in novels are licensed for a few hundred dollars. Bret Ludwig doesn't know what he is talking about. It is all of a piece with his paranoid misconception of the world: little Bret against the monster publishing houses. I've worked with all the largest publishing houses in the world, and many of the smaller ones, and they're just people like everyone else.

> Andre(w) is a liar, a mountebank, and a shithead. It's likely he molests koala bears and craps in his neighbors' hydrangea bushes as well, but this as yet unproven.

These are more lies. But what does one expect from Bret Ludwig, who steals from the living and the dead and brags about it?

Andre Jute

I would suppose that if one used some fairly high resistance wire, and had the resistance / foot data for that wire, that they could "wind" their own 11.2 ohm resistor. I may do that with my 260 some time.

Ed

I am looking to upgrade my Kenwood TS-830 with Inrad CW filters. The 400Hz filter for the 8830KHz IF is "wire-in". I am not sure how it installs. IN any case, it strukes me as a "kludge." Wondering if anyone has used the Inrad 400 Hz 455KHz IF filter in combination with the standard Kenwood 500 Hz 8830KHz IF filter and how that performs compared to the Inrad filters in both IFs.

Tnx es 73,
Barry Newberger W5KH

They owned the same "copyright" that Lindsay Publications owns on all the out of copyright books that they reprint: that additional or changed material they have added, or if they have edited or deleted things the exact things they have edited or deleted. Anyone else besides Lindsay Publications may do the same thing Lindsay has done, reprint a book in the public domain. They cannot add, for example, Lindsay's foreword or addenda he puts in.

Even a King James Bible has a copyright statement: they are seeking to protect the formatting and extra materials such as maps they put in. Although some do not even bother anymore with that.

Believe me, Newnes knows a great deal more than either of us about copyright and copyright enforcement and they would have long ago put the kibosh on these sites if it were improper.

> They owned the same "copyright" that Lindsay Publications owns on all
> the out of copyright books that they reprint:

Then you, Bret Ludwig, or the thieves Gregg, Tim Williams and Choky
Prodanovic, or the thieves who operate their mirrors, must prove that
70 years have elapsed since the death of the last author of the RDH4.

That is clearly impossible for a book published as recently as 1953,
with a revised and expanded edition published possibly as late as 1967

creating yet another of authors and copyrights.

You're wanking hysterically, Ludwig:

> that additional or
> changed material they have added, or if they have edited or deleted
> things the exact things they have edited or deleted.

Are you blowing smoke, Ludwig, or are you growing incoherent in your hysteria? The Newnes edition of 1997 is a facsimile edition of the last, 1967 edition under the old copyright holder AWV. Nothing has been added or subtracted. All that has happened is that the copyright passed from AWV to Reed, mother company of Newnes. Copyright, for your information, isn't a magical incantation, it is just property, exactly like an amplifier or real estate.

>Anyone else
> besides Lindsay Publications may do the same thing Lindsay has done,
> reprint a book in the public domain.

Once the book is in the public domain, sure. But the RDH4 cannot even begin to come into the public domain until 2014 at the very earliest (if all the authors were dead at publication, which we know isn't so because there were revised and expanded editions after that) and most probably until 2038.

Assertion doesn't put a book in the public domain, Ludwig: proof is required, and you haven't even tried to get the necessary proof.

>They cannot add, for example,
> Lindsay's foreword or addenda he puts in.

What has Lindsay got to do with the RDH4? Are you drunk or doped up again, Ludwig?

> Even a King James Bible has a copyright statement: they are seeking
> to protect the formatting and extra materials such as maps they put
> in. Although some do not even bother anymore with that.

Everyone knows the writers of the King James Bible are dead for several centuries now. You, Bret Ludwig, and the thieves Gregg, Tim Williams and Choky Prodanovic have yet to prove the authors of the RDH4 are dead, and have been dead for 70 years. You can't, because only forty years has passed since the last revised and expanded edition of the RDH4. Tough luck, sonny.

> Believe me, Newnes knows a great deal more than either of us about
> copyright and copyright enforcement

They certainly know more than you do, Ludwig, because you know nothing, as is illustrated by your mantra:

>and they would have long ago put

> the kibosh on these sites if it were improper.

"We have stolen the book so often, it is now ours."

Unsigned out of contempt for thief and a pimp for thieves

 It isn't anyone's. If it were they would have stopped it. It's quite
that simple.

"RDH 4 may be distributed free of charge, as has been proven beyond
reasonable doubt. "

So go and eat shit, you puke-eating cur, you sniffer of bicycle seats
and tampon applicators found outdoors.

"We have stolen the book so often, it is now ours."

You flatter yourself, Ludwig, and you flatter the thieves Gregg, Tim
Williams and Choky Prodanovic. Until someone tells them, it is
doubtful a publisher will discover some mickey mouse person on his
mickey mouse netsite offers the publisher's copyright property for
download.
>
```

> "RDH 4 may be distributed free of charge, as has been proven beyond
> reasonable doubt. "

Bullshit. It is in copyright, and the copyright owner is identifiable
and has been identified:
<c>Reed Educational and Professional Publishing Ltd 1997

> So go and eat shit, you puke-eating cur, you sniffer of bicycle seats
> and tampon applicators found outdoors.

Even you abuse is dull, Ludwig. You really aren't suited for
intellectual enterprise. You should stick to shooting at cans and
sniffing solder fumes.

Me? I'm not a grass. I leave it to criminals like you, Ludwig, to dob
in the other criminals, like Gregg, Tim Williams and Choky Prodanovic.

But I don't believe you. I still want to see the e-mail you sent,
complete if you don't mind, so that I can determine whether you did
the job at all, and if your did do it, and if you did do it, did yo do
it right.

Oh dear. You really are a slow learner. These are the facts:

1. The copyright holder is the copyright holder by presumption. They
don't have to prove anything. You, the thief Bret Ludwig, have to
prove that the book is in the public domain. That is the law.

2. They don't have to tell you anything, not even a cease and desist
```

order. That is the law. You're a nobody; you have no standing; you're just another thief.

3. You can't conclude anything from the absence of a cease and desist order. You will still be a thief, and so will Gregg, Tim Williams and Choky.

> They can't.

4. The law is that the wannabes like you must prove they are not thieves. The copyright holder has to do nothing, absolutely nothing, SFFA. That too is the law.

You've made a fool of yourself, Ludwig, for no gain at all.

You've made a fool of yourself because you are out of your depth, Ludwig. I have explained several times how this works but you have either failed to understand or you are such a jerkup that you think your wishful thinking substitutes for the law of the land. (That last is a good definition of a sociopath.)

Unsigned out of contempt for a tattletale and a fool

You're a moral idiot.

There is no fault in notifying the authorities of a crime provided you yourself were not in on the crime. It's when a co-conspirator rats out his fellows that one can be called a snitch. Would you ignore the robbing of an old lady on the street so as not to be a "grass"?

And no, I will not post the email. If you are so big on doing the job why not wrote from all the sockpuppet accounts you post here on when you are having a bad period?

Anything is possible, of course. But it is a proven fact that you, Bret Ludwig is an immoral thief. The only thing shorter than your decency is your dick.

> There is no fault in notifying the authorities of a crime provided
> you yourself were not in on the crime. It's when a co-conspirator rats

Of course not, nor the theft of the RDH4 copyright by Gregg, Tim Williams and Choky Prodanovic, with Bret Ludwig as their tout. Nor, for that matter, the theft from me by the scumball Bret Ludwig.

> And no, I will not post the email. If you are so big on doing the job

It is not that I want to do the job, it is that I want to check you didn't deliberately send the e-mail to the wrong address. We know you are dishonest, a thief in fact, so why should we take your word for anything.

> why not wrote from all the sockpuppet accounts you post here on when
> you are having a bad period?

Unsigned out of contempt for a snitch and scum

No, Horse's Ass, you must prove that the authors, rather than the corporation that financed, assembled and published the book, owned
the copyright.

Otherwise, by the rules of usenet, you'll have to go to hell.

You keep bragging about your publishing experience; this should be a walk in the park for the well connected magnate you claim to
be. Hell, dude, call one of your friends at the CIA or Interpol! They'll be able to research it for you.

But you won't, and you can't, provide anything but more horseshit.

Because you're just another horse's ass.

Because all they ever copyrighted was their formatting.  The content is in the
public domain.

Nobody, certainly not me, said the authors of the RDH3 owned the copyright. I repeatedly said that AWV first owned the copyright, for a fortnight I've said it. You should get your eyes and ears tested, anonymous Phreaddie, or take remedial comprehension lessons.

Australian law says that when an employee creates a book, the employer owns it. The term of the copyright for such a corporate copyright under Australian law is for the *author's life plus 70 years from the year after his death*. Since first publication was 1953, with revised and expanded editions following until 1967, the RDH4 cannot even begin to go out of copyright before at least 2024 and possibly not even until 2038.

Australian law says that when an employee creates a book, the employer
owns it. The term of the copyright for such a corporate copyright
under Australian law is for the *author's life plus 70 years from the
year after his death*. Since first publication was 1953, with revised
and expanded editions following until 1967, the RDH4 cannot even begin
to go out of copyright before at least 2024 and possibly not even
until 2038.

The copyrightholder therefore owns the content until 70 years after
the author's death, a period that cannot even begin before 2024 and
possibly 2038.

All this speculation by you boys is futile wanking.

> until 2038.

This is such a profoundly stupid complaint you have, Mr. McJute.

Let's assume that the copyright *IS* still owned by RDH4, or whoever you THINK owns it.

In order to enforce their copyright, they would have to engage in legal actions. This would normally start with a "cease and desist" letter. For any publishing company, this would require at least a meeting between attorney and probably several management level employees, the lawyer would then go off and research the issue, and write the C&D. This would then be forwarded back the the client; they would circulate the draft among the management employees and likely have at least minor changes to the form and substance of the letter. The attorney would rewrite, and assuming all goes well receive approval from the client to issue it.

The attorney would then need to locate the exact details of the owner of the website in question (and from what I gather this material is routinely available from a number of websites). Research would be done and perhaps at long last the C&D would be sent, probably by some kind of signed courier.

Total cost? Easily US$5000, perhaps up to US$10,000.

MORE THAN ANY ROYALTIES BEING RECEIVED BY RDH4 FOR THIS COPYRIGHT!

What you don't seem to understand about business, Mr. McJute is that these kinds of management decisions are made by experienced business people every day of the week. They are decisions based on sound business practice and not "vanity". You've clearly published several "vanity" editions of so-called novels, and rightly believe that you should enforce your copyright to this drivel. That's your right, and you might actually prevail (there being no evidence that even with the miniscule cost of digital storage, no one has yet seen any purpose to steal your vanity books).

There would be no business sense for RDH4 to enforce such a copyright, even if they are the owner. The demand for these publications is near zero - they are antiquated reference books at best and I would guess many libraries that might have a copy would be in the process of getting rid of it, as libraries routinely do with out-of-date scientific publications.

Many in fact would agree that digital availability for books of this type is a public service, that these volumes have actually been liberated from their lack of circulation.

You're apparently one of them anal-retentive troglidytes

ARRL Article at URL:
http://www.arrl.org/news/features/2007/09/28/03/

Sez
The Transmitters

The radios on board Sputnik are described as D-200 units and were designed by a member of Korolev's design team named V. I. Lappo. 11 The meaning of the D-200 designation is unclear and our research thus far has failed to produce a schematic of this transmitter, but Tikhonravov, in a presentation before the 24th International Astronautical Congress in 1973, characterized the transmitters as "vacuum valve-type" with a power of 1 watt. 12 Figure 3 shows the transmitter unit mounted adjacent to the antenna connections in the front casing half. One transmitter operated on a frequency of 20.005 MHz (megacycles in 1957) and the other on 40.002 MHz. The choice of these frequencies not only allowed reception by amateurs using existing equipment but also enabled a receiver set at exactly 20 or 40 MHz to produce an audio tone plus or minus the Doppler shift without ever going through zero Hz. This insured that the telemetry was audible throughout an entire pass without additional tuning of the receiver.

Lamont who saw the booster rocket in the sky in 1957.

As I recall an Amateur at Convair Pomona -- heard transmissions on his Ham gear.

There is a great deal of technical information on Sputnik here (no
diagrams) http://www.arrl.org/news/features/2007/09/28/03/

The article makes reference to the Institute of Radio Technology
whereby they flew a duplicate of the Sputnik 20 Mhz transmitter for
receiving practice. I made a quick search, but didn't find anything
on that organization.

I remember being in a friend's shack in Detroit, after school, listening
to Sputnik on an  RME-4300 receiver @20 Mcs.    If I'm not mistaken, the
signal was a keyed "U" for the USSR.

Large publishing concerns have attorneys on staff, who have nothing else to do, besides this. It takes one about ten minutes to run off a form letter and send it FedEx to the people involved. It takes even less to send an email stating that we believe this is inappropriate use of our IP to someone's ISP. We are talking fifty to a hundred dollars of company time as internally billed.

Even if the amount is trivial, large publishers, and most small ones, do the level best they can to stop unauthorized use of any and all lawful IP. If you in good faith, with an active email address, put up something not in the public domain it will not be long before you hear about it.

RDH 4 is absolutely and positively public domain now.

A lot of desireable material isn't and arguably ought to be. I have of course written my legislators, two of which are neocon fellating whores and one basically a lazy careerist, so it is a waste of postage. but what I view as good citizenship on my part.

I sold Jeff Angus a Gibson BR-(7?) that dated to 1946-7 maybe. It sounds like a mighty useful amp to me and worth the attempt.

Good morning... Looking for the BEST place to mail-order replacement caps and other components for restoring boat anchors.

I did the deja and google searches and got the usual hundreds of thousands of hits, now I'd like to know what you guys consider the best place to deal with mail order.

Current project is a DX-40 and I need some 40-uf 450-V electrolytics and replacements for a few misc. paper caps.

Radio Shack has nothing, as usual.

I suppose ordering two electrolytic capacitors and two paper cap replacements will be a losing proposition because they'll raid me for more on shipping and handling charges than the caps are worth, but if there is anyone out there who's reasonable on that kind of stuff I'd appreciate hearing about them.

I suppose if I'm going to get into this boat anchor stuff I should buy an assortment of caps and other parts... any suggestions there?

I had one of them several years ago. After I changed all of the bandpass filter switching diodes to 1N5767 PIN diodes, the IMD products were eliminated. It was a well built unit, with glass epoxy boards, but I wasn't crazy about the flourescent display. I eventually traded it off.

You really can't go wrong with either mouser.com or digikey.com
Otherwise, you'd really have to define your definition of BEST.

Good afternoon, observer.

Well, of course "best" is subjective, but I'd like to hear people's own personal favorites based on their own definition of "best".

I consider "best" in terms of good inventory, reasonable prices, and reasonable shipping and handling fees. I especially don't like paying more in shipping and 'handling" fees than I pay for the merchandise.

I have dealt with Digikey in the past and always found them a bit pricey but with good inventory and good response. Haven't tried Mouser yet... will give them a shot.

Thanks...

Digikey and Mouser are good, if you don't mind wading through their
catalogs carefully to figure out which modern components are just right
for you.

Antique Radio Supply (www.tubesandmore.com) has a selection of
high-voltage new capacitors (including some low-end audiophool stuff, so
watch that price column!). They also have some specialty reproduction
electrolytic capacitors if you want to retain the right look to your
chassis -- this is a 'don't care' for functionality, but if you're doing
something with an open back you may want to let people see that aluminum
can sticking up instead of some ugly blue thing.

That looks right. Unless I was willing to do some analysis I'd replace them with tantalums that have the same general look, and expect to replace them again down the road. The only real alternative that would approach the size are niobium or other rare-earth caps which have aging and performance characteristics that are substantially the same as tantalums, or some of the newer aluminum electrolytic caps which will tend to have a shorter life (although with less dramatic failure modes).

Yeah, I suppose with mods it would have been ok. A friend bought Yaesu
FT-ONE transceiver from an estate sale, and it had a fantastic receiver
in it. I wanted one really bad until I realized that his had been
extensively modded with PIN Diodes, and was tremendously better than a
stock radio was. By the time I found one that was reasonably priced
enough to get fix and modify, I didn't want to mess with it anymore.

Tantalums are quite reliable if you choose them correctly.

The usual causes of short life are the magnitude of applied voltage, and charge/discharge current.   As a rule of thumb, pick a capacitor that has a voltage rating that is a minimum of 2 times the maximum voltage the capacitor will ever see, and you should be ok.

High charge and discharge currents can sometimes be solved by using a series resistor between the source that you are filtering, and the capacitor that is doing the filtering.

Applying reverse polarity will cause an extremely short life.

-Chuck

Quite simply..... Mouser. I've tried the others, from time to time, and always return to Mouser. They have what I need and I have not been disappointed with items not being in stock. As an aside, the price of can electrolytics from Antique are... well, let's just say overly expensive for what you get. I simply put small tubulars underneath the chassis and be done with it. de K3HVG

New to group. I have an extra Marauder, fully working in pretty good cosmetic shape. I would like to trade it (or deal for) an Apache. Since the Marauder works (and I have a full manual) I would like the Apache to also work and be complete. If interseted, please e-mail me. Thanks, and keep the green stuff working!!!

I have an old SBE Model SB-35 HF Transceiver.  It's in good condition,
and I'm trying to determine what the value of this vintage Boat Anchor
might be.  It's been setting around, so not sure if I want to plug it
in for fear of escaping electrons from vintage oil filled
capacitors.   I understand that not many of these were sold in the
USA, which makes me wonder about how they would compare against say
the SB-34 or SB-36 ??

If you have any thoughts, please drop me a line

Rick,

If you don't change the electroytics they might short, explode (kinda like a firecracker) and damage the power transformer. They're hard to get and expensive. A radio this old will need hem done sooner or later so why risk it. Antique Radio Supply has some new ones or you can series/parrellel new ones to boost the voltage ratings. Also change any paper caps---mandatory they leak and cause hard to troubleshoot problems. remember they usually block hv dc and pass ac soon when they do that half way watch out. This is kind of a rare transmitter so spend a few bucks and treat it right you might get your money back in a reaale or just plain enjoymnent.

73 Tony

Introducing The Dhourties And The Dualdigers, Nudism? Nakedity? Aren't
We Born Naked? Isn't Our Naked Skin Our Clothes? Is Being Born Naked A
Crime By The Dhourties' Logic If Nudity In Public Is A Crime?

The Dhourties' Fortresses For Killing 'Dualdigers' Off - The Dhourties And Their Control Of Dualdigers, In Fortresses For Killing Off Dualdigers - Molding Up Bread - Clark County Detention Center - Lewd Conduct Brings You Closer To GODLYNESS, Or The Love And Chastity, Or The Beauty, Elegance, And Grace Of GOD's Love For My Children - Sexual Compassion For And With Others And For And With Self - Balancing Out Karma, It Is My Way, Or Thou Shalt Takeeth The Highway! And Getteth Thoun Self Out Of My Universe! - The Ludicrousness Of Playing 'Footsies' With The Insanity Driven Dhourty Government - What Is Lewd Conduct? - Storing And Dealing With Your Karmic Records - Rules Of Conduct For 'Permission Granted' To Sexal With GOD, That's Me - The Dhourties Are Not Informed As To What I Am Doing, And Few Of Them, Know Any Thing At All About Me - Lewd Conduct Should Be Advanced, Not Prohibited, In A Sane Society - Organ Animals And Sexaling - All Hands At The Quarter! Ready Your Weapons! Off Shoot Now! Keep Firing Till Ordered Otherwise! Updated: 10-02-07 Rev.g 22:47 PDT

The Dhourties' Fortresses For Killing 'Dualdigers' Off

Recently, on August 5, 2007, at 19:50, I was arrested for 'lewd conduct' bkg. code 5131, (later struck through, and changed to), bkg. code D169, Charge ORD/NRS# 12.32.020 (CCO) 0200- with the 0200- appended, Sector Beat S1, that's the best I can make of the copy I have, a photo copy of one of the original copies. CCDC OR 369/365/A, with '369' struck through. I.D.#087884, struck through, and changed to, 2647396. Event#070805-2517. In the side column of the Temporary Custody Order, it has in hand print, '1-N RT(1) nonit'. Time Stamp at BOOKING 07 AUG -5 23 27. DSD RECORD SECTION.

When I left, I was given a sheet of paper, a 'sign off by offender' sheet, with this information on it:

08/06/2007 02:36 I4732H, OIRPTRAN 6.04.4.1, Name: Ayres, John ID#0002647395, Admit Date: 08/05/2007

Date: 08/06-2007 Officer: 1544 14732H

This was for regaining my property from the inmates properties room.

I was arrested at Tropicana and Decature, on Decature, next to the area where I have my 'Gurkian Way Ministry' sign up on a large, 7 feet by 3.5 feet, 3/4 inch piece of plywood, and where I have another sign, that clearly states on the same size piece of plywood, 'GOD's Place, John Francis Ayres, And Children', where I was doing my 'Tai Chi' aerobic excercise karma erasal religious ceremony, with no clothes on.

I explained to the arresting officers, that I am duty bound by my religion, to do my religious karma erasal religious ceremonies, as well as all my religious ceremonies, naked. I explained that I am GOD, and that I am starting my own, or rather, my newest religion.

The arresting officers had many complaints from the 'assasins' group of 'hired killers', and torturers, who live in the underground, below and surrounding, the Home Depot, next to the New Orleans Hotel and Casino. Their underground complex is in part, under the New Orleans Hotel and Casino, as well.

They apparently, call the police, every time I come to my 'Gurkian Way Ministry's' office site, where I do my Tai Chi aerobic excercise, religious prayer activities.

I had been visited twice, once as noted, previously, and once by a second team of police officers, who told me to just stay in the area, where I had been sitting, and doing my Tai Chi aerobic excercise religious prayer activities, and the officers told me to not wander out naked, into the area surrounding my area, as, it was explained, that passer's by will get "offended" by my nakedity or 'nudeness' in public.

I try to figure, how can some one get offended by looking at a naked man? It's a mystery to me. Anyway, it does seem to be the case, that people can feel uncomfortable, if some one is naked, possibly, and that person would not like to approach the person, who is naked.

Well, if that is what is meant by 'offended', I don't know, but it does seem to pose a problem, for people who may feel embarrased by standing close to or talking to, some one who is naked.

What is a Dhourtie? It is a slang term the Lesbianists use for a 'warlock'. The Orson Well's movie, 'Time Machine' portrays ugly, long, greyish white haired, mutant people, who can see in the dark, fairly well, who serve the people on the surface of the planet, with apples, and pears, that the 'warlocks' apparently pick and place out at night to feed to the peaceful people.

The warlocks, then eat the people who live on the surface of the planet once they lure them down into the underground labrynth of underground caves, and tunnels. A 'dhourty' is a Lesbianists' slang term for a 'mutant', or 'warlock'. The peaceful people, who live on the planet, as shown in the movie, are termed, 'Dualdigers', by the Lesbianists. 'Dualdigers' is a slang term for the peaceful, but apparently lazy, sexually attractive, people who live on the surface of the planet.

Some one also makes their clothes for them, as portrayed in the movie, anyway, as the peaceful people, the 'dualdigers', were all clothed, and had neatly groomed hair. They also apparently, regularly, brushed their teeth, and no one got cavities, except for a now and then, unlucky person, perhaps.

The people on the surface of the planet, apparently do not know how to fight, and apparently, never have any thing to do with violence, except for a now and then, quarrel.

Well, regardless of the movie, and its fictitious portrayal of human life, as I don't know any one who acts like those people who are living together, and loving together with each other, so peacefully, the movie is where the terms for 'dhourty' and 'dualdiger' get their start, in slang language, I suppose.

A dualdiger, I explained, before, in my early notes, as an animal, who is a potent, I believe I said it was, who is part plant, and part animal. It is a peculiar looking animal, and it is a silly looking animal. I think the term, 'dualdiger' comes from this animal.

'Dhourty', probably originated, similarly, that is, it is a name for a strange looking animal, a potent, or another of the many types of animals, that are too tiny for us to see, who live in the 'sub molecular' zones, as I was talking about them, before.

Remember, I said there were approximately 600 million zones in the 'molecular levels', or the levels above what we would think is the area where we might be able to find, molecules. There is a cut off point, and below that level, in the lowest of 'molecular zones' there are sub molecular zones.

The zones are living zones, or cosms, as I explained. They are habitats for living organizms. Below that level, the molecular level, cut off level, there are 900 billion zones, or cosms, as I recall I may have said, in the sub-molecular zones, before you get to the bottom.

At the bottom, there may still be smaller animals, living below that level, and I believe there may be, but am not too sure, and I don't know for sure, but if there are animals, living below that zone level at the bottom, they are not as multipously populated, or numerously with such a large number, and large multiple of different types of animals, and they are not that densely populated zones or cosms, living habitats, as the ones above them.

It must be hard for animals to find food, down there, in those such areas, below the bottom. It would appear to us, as the artic, or antarctic, where conditions are difficult, and few things live there, or so it would seem, from what we are shown on television, by the dhourties, the Lesbianists, on this planet.

I don't know what the real story is, below the bottom level zone, but we'll find out, in time, as we begin to study, in the 'Managing My Universe' program. Now that I mentioned, it, I think there are lots of animals, living in very tiny zones, way down there, but at what levels, those animals are living, I'm not sure. There are many abominated human beings, living in the lower zones, along with the animals in those zones, so just how small people get, and what kinds of animal people they have become, we'll find out more about, once you begin studying in the 'Managing My Universe' program.

The Dhourties And Their Control Of Dualdigers, In Fortresses For Killing Off Dualdigers

The dhourties apparently control society, and they control the County lockup facility, as when I was there, in a 'Dhourtie Fortress' for killing off dualdigers, dhourties were in large numbers, busily beating up inmates, being rude to inmates, torturing them, forcing them to live in cells on cold, hard floors, with no blankets, and with forced ventilation air conditioning, which is very cold.

The air is toxic, and is filled with fumes animals, of all kinds, but primarily, from two sources, as far as I can figure, the one source, being, air coolant fumes. The other source, industrial cleaners fluids. Both are vaporous, and contain high levels of toxic animals. There are also, at the county lockup facility, large numbers of 'asbestos' animals, in the air, that the prison visitors, are forced to breath.

I was nearly choking, on the asbestos animals, by the time I left the facility, at around 8:30 a.m. I was arrested, the night before, and was transported by van, which was picking up other, soon to be visitors, to the facility, for a number of hours, before I arrived at the Clark County Detention Center, the lock up facility for booking 'visitors', after 11 oclock, that evening, I suppose.

It seems there are facilities underground, below the detention facility, where there are tunnels, and 'caves' laboratories, that they house prisoners in, who are then, cruely, and miserably, tortured, eaten, and killed by the dhourties, who run the facilities, and who run the government, and who run our planet.

Even below normal businesses, such as SONY, or Admiral, or Westinghouse, or General Electric, and below the military bases, of course, as well, similarly to the situation below the county lockup facility, and below the New Orleans Hotel and Casino, and below the Home Depot, there are facilities the 'dhourties' have built, to hide and house people, ordinary people, who have been abducted, and who are being tortured, abused, humiliated, criminally assaulted, eaten, and killed by the dhourties, every day, around the world.

There is no country that does not have these facilities, and all government facilities, and all prisons, and all county and city lockup facilities, and all military bases, and all college campuses, and all large public and private schools, have these facilties. There are also these facilities under civilian housing areas, such as under large housing complexes, where the governments have constructed low income housing for low income wage earners, or ordinary people, the dualdigiers.

This is pretty much the case, nationwide, and world wide, and you will not find a country in the world, with out this set up, constructed by the 'dhourties' who run the governments, and who run, every aspect of society, including, dictating how we piss, and on what kinds of comodes we sit, shit, and piss into.

We are driven and managed by the dhourties, daily, and they are every where. You will not recognize them, as they look like normal people. They are not mutants, not in appearance, any way. They do have brain deficiencies, however, and they are not clever enough to beat me, GOD. Their brain deficiencies, are of the organic kind, and that means, down in the wiring, they have problems, and their brains do not work for them, any more, in lots of ways. They may seem normal, on the surface, but they are far from normal, down in the wiring, as lots of it has short circuited, and there are many blown fuses. They are not capable of knowing what 'common' sense is, these people with brain deficiencies. They can fake it, but in side, when they have a question, as to what they should do, they can not answer it, without the assistance of their code books.

They have numerous codes, and code books, and these are there, to help them manage to survive, and thrive, in the real world, that they created for them selves, and for the dualdigers, to live in.

I have no intention of returning to the Clark County Court House, for my trial, in Justice Court, on Sept. 5, 2007, in less than thirty days, at 7:45 a.m. I have no intention of playing their game of who takes control of whom, as I will not stand for their intolerable system, their societal system, that they have established for the dualdigers to follow.

I didn't mind going into their buildings, before I learned that their buildings are death traps. I am not going to show up for my court trial and play their game of 'footsies', just, as if I can help it, I will never pay taxes to this or any other dhourty government, run by the dhourties, and that is all of the governments, on this planet.

Yes, I have to pay minor taxes, on food and liqour expenses, and on clothing expenses, and so forth. That is taken from me, without any one asking me, if I would like to pay it or not, and I have no choice, but to pay it, or I will not recieve the item, or items, I wish to purchase.

I am not going to stop my naked dancing, that is, my Tai Chi aerobic excercise, religious prayer activities, if I can help it.

I don't think any one is embarrased by being close to a stripper, in a night club, or to a can-can dancer, with little to no clothes on, in the casinos, that line the strip, here in Las Vegas.

I don't think the ladies, feel embarrased, when they go to the male stripper clubs here in Las Vegas, where the ladies, of all ages, whoop and holler, get all powered up, sexually, and call out at the male stripper dancers to 'Show me more!', etc.

Isn't it peculiar, that the dhourties who live in the drainage system, next to where my camp site is located, in the underground tunnels, systems, complain to the police about my being in 'their' park, and 'dancing' nakedly, and 'jerking off', that is, religiously expelling sacred and holy fluids, as I've expalined about, as well, and acting in a 'bizarre' manner.

Well, I don't think they are being truthful, as they are all dhourties, most of the people calling in, and the dhourties want me off their property, so that they can go on, killing unsuspecting tourists, travelers, down and out people, who may camp out in the park, or who they lure to the park, after making a casual friendship with them.

I will not stand for this, intolerable arrangement in our society, and no one should. The whole area of Downtown Las Vegas, should be leveled, and blown out to expose a wide, gaping hole in the ground, and every facilty of theirs underground, should be destroyed, and turned into dust, rubble, and dirt particles, in the explosion(s).

The underground casino areas, including the New Orleans Hotel and Casino, and all of the other, dhourtie hotel and casino establishments, and their facilities, below them, should also be blasted and each one left as a large gaping hole, using the explosivies formulas, that I have provided on my bulletin board.

I would like to see every single one of the dhourties expelled from this planet, and blown to bits, leaving nothing but traces of their brain wiring, and bits and pieces of their bodies, behind. However, that is impractical, as I will not have any children, among the dhourties, left, on this planet, to practice my religion, after they are introduced to it. It is a religion that will be here forever, and I need people to practice it. I can not go around killing every single shit head kid of mine, and expect to get any where, religiously, after I have killed them all.

Though they may be shit heads, and though their brain wireing, is faulty, and not workable, for them, much of the wiring, any way, and though my 'ordinary' kids, may not be too much better, in terms, of being a human being, I can not go around killing my kids, just because I do not like them, and I do not approve of their behavior.

We will have a justice system, of my own, when we get my children, who have the technologies, to build my criminal justice system, according to Gurkian Law.

I have had enough of their bullshit criminal justice system, that they instituted, and as soon as I can get my religious prayers said, as I do my Tai Chi aerobic excercise religous prayers activities, in the park, from week to week, from month to month, and from year to year, I will get my kids to build my criminal justice system, and I will be seeing the shit head kids of mine, placed into prison cells, and then corrected, before allowing them to be released. That goes for all of the dhourties, and for all of the dualdigers kids of mine, who do not act, properly, and who do not act peaceably.

We have a lot to learn, about my universe, and about the people who are living in my universe. I will have all of them, practicing my religion, in time. There will be no if's, and's, or but's about it, as I am going to make all my children, work for me, whether they like it, or not. I have a long time to get my program, up and running, and these things do not take place, over night. It's one planet, at a time, and in some cases, there are lots of people, interested, in my religion, already, and they are responding, variously, the ones who have the technologies, to be able to look in, and see, from time to time, what all is happening, here on this planet, with me and my religious efforts.

IS THAT CLEAR! I HOPE It IS CLEAR, SAILOR!

Molding Up Bread

Ask your friendly, neighborhood dhourty, who will cooperate with you, for more information, as to how to mold up spices, and flowers, etc., and for information on molds, in general, and so forth, as they know all the secrets, and tricks, to molding up every thing possible, successfully, as they were trained in the molding sciences, and they are all, certified moldists, who can teach you every thing you wish to know about molding sciences, and every thing else you need to know, to feed the organ animals, in your body, for you to regroverate your body, successfully, and for you to get well, from all the illnesses, that the dhourties, have helped you to get sick from. Show them the same kindness they show you, and be kind to them, as you invite them into your underground lairs, where you will be having them stay with you, as sexaling guests, and as teachers, to teach you about the molding sciences, and other sciences, you need to learn about.

Living Forever On Molds, Foods For Feeding Molds Animals, And Sexaling Juices

See my bulletin board, for more information on 'living forever' by eating molds and the foods they eat, to feed your organ animals, the foods they need to feed on, to be healthy, and to allow you to live forever. In addition, you need the male and female sexaling juices in your daily diet, as I've explained, on my bulletin board, which will allow you to get the spare parts, or baby organ animals, and other animals of all kinds, that you need to replace old and worn out, organ animals, etc., in your body with to allow you to live, forever. There is more to this science of regroveration, then I have recalled, so far, obviously, as this is a complicated science, that involves many things. As I remember this stuff, I will let you know what we've missed. My amnesiatic conditon is not helping me to recall every thing I need to recall, all at once. Find your self a cooperating dhourty, and get their cooperation, and you'll learn more quickly, and accurately. They also have pledged to teach you, all the molding sciences, and so far, they have not been fair, and they have held back this knowledge from you, so you deserve a break, and they must teach you, or they will do jail time, in my prisons, after my kids build them for me.

Clark County Detention Center

It is an odd thing, when they ask you your sex, and if you happen to be a girl, with a dick attached to your body, they call you a 'mixed genitals' person, rather than a 'male', or a 'female'. They do not check to see if male's have vaginas or not, and so only women, get listed as 'mixed genitals' persons. This is very peculiar. I was told to sit on the 'male' side of the room, where only males sit, in the booking intake area. There was a female sitting next to me, and she apparently had a dick, and so they listed her as a 'mixed genitals' person, or a 'GM' for 'genitals mixed', rather than, 'female'. This is very peculiar, as only women are selected for this gender specification. It is not a gender specification, obviously, and the dhourties know it, and they are just goofballing every one, pretending there is some thing about a woman, who has a dick, that some how makes her a non-gender person, and that non-gender person, is a 'mixed genitals' person. She becomes confused, as she is told to sit with males, in the jail house, and she is jailed, I suppose, with males, as well. This is very peculiar, if you ask me, but it seems to be the case. If all men who have vaginas, were placed in a 'mixed genitals' classification, and were then told to sleep together in wards with mixed genitals women, I don't think that would be such a bad idea, but that is not the case, and only women with dicks are told to sleep in wards with males with dicks only, or males with vaginas, as well as dicks.

It is a goof ball situation, in the Clark County Detention Center, and I wonder how they figure their way through this situation.

On the premises of the Clark County Detention Center, the dhourties poison you with fumes animals of all kinds, and asbestos animals, in the lock up facility, and if you happen to develop pains, due to those poisonings, you are out of luck, as you will not be prescribed pain relief medications by the Clark County Detention Center medical staff, as they are not allowed to prescribe to you, a prisoner, any substance that is addictive, unless you have surgery, or unless you have a clear breakage of a bone in your body, such as ribs, arms, fingers, and so forth, or unless you can show that your body is severely damaged, such as from a knife wound, or from an other type of wound you recieved, during a fight, with an inmate, or guard for instance.

I will not be going back to jail, or to the Clark County Detention Center lockup facility, or to any of their lock up facilities, their fortresses for killing off the dualdigers, as that would be a death sentence, and I do not have the karma to die, so I will not be seeing any law enforcement agents, at my door, or in the park, once the Clark County Justice Court issues a bench warrant, for my not showing up for my court and trial date. I am GOD, and if any one could figure it out, I am doing religious prayers, and doing religious prayers, is not a lewd act or lewd conduct, even though I am naked while doing my prayers ceremonies. I was born naked, and I will continue to live, naked, in the shower, and in the bath tub, and when I am changing my clothes, and when I am sexaling, and when I am doing my Tai Chi aerobics prayer ceremony activities. Lewd acts are simply, acts that solicit sexual engagements with others, in the simplest sense, and so a wink would be lewd conduct, and a smile would be lewd conduct, and no one is going to go to jail, for those, except maybe in Muslim countries, where the women wear veils to cover their face, and where they force women and girls to wear gowns to make women and girls appear as if they live in a sack, in many cases.

Lewd Conduct Brings You Closer To GODLYNESS, Or The Love And Chastity, Or The Beauty, Elegance, And Grace Of GOD's Love For My Children

Sexual activities are not within the domain or realm of human beings to cast judgements about. Sexual conduct is not within the domain for human beings to cast judgements about, or to make any opinions about, legal, or otherwise. Why not? Because sexual conduct and sexual activities are devine, sacred, holy acts that can not be looked at in any way other than from the perspective of holyness and the graciality, or gracenesses of GOD, that's me. Graciality is sacred GODLYNESS, or Devine rapture with GOD.

Governments have no jurisdiction or decision making powers or authority over matters that deal with spiritual beingness, and one's relationship with one's creator, GOD, that's me. It's arrogance on the part of any person who thinks that he or she can regulate a person's behavior that brings one into direct contact with one's creator. The karmic scores for this type of mistaken belief and practice, by any one, are high, and the outcome is a punishing one. The penalties for interfering by legislation or by any other means, with a person's rights to live in harmony with one's creator being by advancing one's sexually committed life style of sexaling freely with people and animals to reach a higher state of goodlyness, and grace, and in time, make a closer bond and contact with one's Creator, GOD, that's me, is not a light penalty, and this behavior of legislating out by laws, codes, and regulations the rights of an individual to practice sexually commiting oneself to others by sexaling freely with others for reaching higher states of goodlyness and grace, and contact and closeness with one's Creator Being, that's me, GOD - and I'm the one responsible for all of this, as should be obvious by now - is folly, foolishness, drunken gayety, and ludicrously laughable behavior.

If and when you become devinely raptured with GOD, that is, when you begin to sexually orgasm and erotem or experience sexually orgastic and erotic sensations as a result of sexual mindfulness, and sexual contact with others, you are in the supreme state of graciality, and that means you are one with GOD.

To state any thing about the holy and sacred activities of sexaling, sexual mindfulness, sexual compassion for and with others, other than they are devine act, and acts that brings you closer to GOD, and acts that allow you to breath in the goodness of the GODLY spirit, or the love of GOD in your life, that means, the raptured sexaling orgasming goodlyness of a good orgasm, with full motors engaged, and all orgasming potentials realized, is folly and ignorance based behavior.

For humans to comment on rapturing with GOD in a sense of, is it good or is it bad, is sheer nonsense, and unacceptable, by any standards. It is a devine act that brings you closer to your creator. To say sexaling is this way, or that way, and so there fore, we are going to prohibit it, and so forth, is sheer lunacy, and not a notion that can be universally accepted as a reasonable statement by a reasonable person. It is the banter of minds that are insane, that state such remarks.

Sexual Compassion For And With Others And For And With Self

Sexual compassion for and with others, are the actions of engaging others to sexually erotemize them, and in so doing, to erotemize oneself, and to sexually orgasm others, and to orgasm oneself, for the sake of clearing up, or cleansing their and your karmic distresses, or karmic failures. Karmic failures are the naughtynesses, or misbegotten, mindless, dhourty like, animalistic behaviors, that lack compassion, and that lack mindfulness, and which is rife and riddled with jest and gayety directed at the victims of their torture sessions. This is mistaken, mindless, and uncompassionate behavior that causes undue and unjust suffereings and miseries to others, and draws one and all of my chidren further away from their relationship with their Creator Being, that's me, GOD.

Balancing Out Karma, It Is My Way, Or Thou Shalt Takeeth The Highway! And Getteth Thoun Self Out Of My Universe!

On the one hand, there is a need to balance out one's karma by engaging a person's life, and by bringing that person to a point of suffering where at the mathmatical formula for balancing out karma, and cleansing a person of his or her karma, will be satisfied. This need to balance out one's karma is based on a mathmatical formula, that must be followed, to allow people to balance out their karma, so that they can live as a nearly decent human being.

The need to engage others, in retributional recoursivistic actions, for the sake of balancing out their karma for them, is a compassionate act, that can be done with passion, and compassion, if one's mind is a 'pure' mind, and the mind of GOD, that's me, John Francis Ayres.

Only my mind is pure enough, and capable of GODLY passion for my children, that will bring a proper result to the lives of my children for balancing out their karma. The dhourty menacers, think they are mini gods, and they think it is their right and obligation, as stated in their code books, to help others with their karma, and so they are always, brutally punishing and tortureing others.

There is a long history to this, that will help explain how this got started, and I am partly to blame for their beginings as an organization, as I helped design and write their code books. It is not clear in my memories how much I helped them to get their start, but as a sexaling lay organization, they had and have the right to make their own code books, that follow basic premises, established by me, long ago.

Their behavior is too far out of line, but I used them as a supplemental assistive group of persons to assist me, in many ways, to allow my children to get their karma straigtened out. It was and is an imperfect organization, as it is run by imperfectly minded people. It is time to disband their organization, as now, in the Gurkian Age, there will be no other methods allowed for straightening out people's karma, other than the one's that I insist on, the ones that I implement with the assistance of my working children, the ones that I will use, to straighten out my childrens' karma, over time, as we progress along to the future.

The Ludicrousness Of Playing 'Footsies' With The Insanity Driven Dhourty Government

For me to contest a charge of 'lewd conduct' with the insanity driven Dhourty government is not an act that I will be engaging myself in. By insanity driven, I mean they believe they are all mini gods, and they believe they have the ultimate right to determine others' destiny. This is sheer insanity, and they are all mentally ill, and that will be proven, once you begin your studies in the programs that I and my working children have lined up for you to study and participate in.

What Is Lewd Conduct?

Lewd conduct is an act, that draws others to a higher state of knowing GOD, in that if you engage in a sexaling act, as a result of 'lewd conduct', or the act of soliciting others to make a sexual statement, or that is, to solicit others to commit them selves to a sexual activity, or action, for me to contest a charge, of 'lewd conduct', as I was saying, is sheer nonsense, and ludicrous behavior, and it is not in the domain of human beings to condemn 'lewd conduct' as lewd conduct is grateful to GODLYNESS conduct, as lewd conduct, and lewd behavior of sexaling with others, which is also a type of lewd conduct, is a sure way to reach higher states of grace, and that means, you grow closer in contact with your creator as a result of your lewd conduct.

Gratefulness to GODLYNESS is a condition of being enraptured during the sexaling orgasming phase of sexual and erotic thrills inducing activities. The ejaculation and orgasming of males, and the orgasming and ejaculation of females, and the running or flowing of the sexaling juices from a females' body brings on a higher state of grace, and it brings you closer to your pure, devine, self as a 'child of GOD', and I am GOD, and I know this kind of stuff, so take my word for it, and get your brains, unbrainwashed, and get your dicks and vaginas busy, and learn what purity of self is all about as you sexal for weeks, and months, and years, non stop.

The longer you sexal, the higher you will go, in terms of reaching a higher state of closeness to your Creator, that's me, GOD. For the dhourities to unfuck up them selves and their brains, and for the dualdigers to unfuck up them selves and their brains, and for them all to get their act together, to where they can appreciate the higher states of GODLYNESS, will take some time, maybe a few kabillions plus years, or more. I am, technically, a dualdiger, and so I am also in that lot, but I have an advantage, in that I am GOD, and it is easy for me to stay pointed in the correct direction, for gaining a higher sense or appreciation, over time, for the Love Of GOD, as my brain is minorly connected to that state of being. There is a connection, in my brain, that will carry me forward, and that will allow me to lead all of my children, to this higher level or state, or condition of beingness in harmony with the Love Of GOD, over the years we are sexaling together, in my religion, during my religious ceremonies and all of my religious activities, forever.

With your experiences of coming closer to GODLYNESS, your life becomes purer, and your karmic records that you carry in your body, hidden behind the particals in your body, on different layers, or dimensionalities, and you can learn more about this, in the courses we offer, for you to learn to sexal for a living, and so forth, the records you carry begin to disintegrate, and they pale or loose their sharp, duralangular edges, is one way of looking at it.

Duralangular edges is a term used in math, and I'm not familiar with it, but it must be something to do with geometric shapes. In any case, the edges sharp off, and that means, they drop off, and begin to form more loose, or flowing, curvatures, as they disintegrate. Think of a box with sharp edges. If the box is beaten on the edges, the box will loose the sharpness of the edges, and slowly, if you beat at the edges of the box, long enough, the box will begin to crumble. Well, it is sort of the same thing, and your karmic records have these types of geometric shapes to them, as we package things to do with your karma, in tiny containers, and then affix them to your karmic records. This sounds peculiar, but we have a way of doing it, and it works well, and we can disintegrate these 'packages' or capsules, and as we do, we straighten out or make lighter, your karma. This needs further explaining, but you'll study it in your courses, when you begin to study for the various programs we have for you to take and learn about how things work and about how things are in my universe.

The sharp edges are slowly, very gradually, lost, or smoothed off, and your karma changes, slowly, very gradually, as you acquire more and more knowing GODLYNESS, and knowing GOD experiences for your self, as you orgasm your way to blissful, purity.

It takes a lot of coming closer to GODLYNESS experiences to do anything significant for your karma, and for cleansing the karmic records in your life, the ones that are hidden in the dimensionalities behind the particals that make up your body. There are layers and layers of dimensionalities, and they nearly go on, forever. There is a limit to them, however, and between this dimensionality, and the final dimensionality, you have huge, and vast store houses of stockpiled karmic records. We find lots of places to hide them, and you won't believe how long it is going to take you to get all your karmic records that are stored not only in the layers below the particals in your body, but elsewhere, through out my whole and entire universe, behind the particals or in layers of dimensionalities, under the particals, that exist as matter, and as types of energies, and as types of many other things, throughout my universe.

Storing And Dealing With Your Karmic Records

Your records are stored from here to kalamazoo Michigan, and that is a phrase that says, they are every where, and the amount of time needed to erase them all, and deal with them all, bit by bit, is quite large. We've been here, a long time, and we've stored up your karmic records, every where. If you think this is a simple job of erasing your karmic records, you are mistaken, and you had better prepare your self for a long term, and long haul project for erasing your karmic records. Though the process of cleansing your karmic records is slow and gradual, through the knowing of GODLYNESS experiences you acquire, over time, the cleansing effects do occur, and your karmic burden is reduced, a tiny bit. You have stockpiles and stockpiles of karmic records, and we have found every imaginable way of storing them, and we have shrunken them down, to pint sized records, that are very tiny, and we have the technologies to do this, and we can resize them, and then place them inside of the holding cells, in the many dimensionalities behind, or underneath of the particals in your body, and in your vicinity where you live, and near the planet where you live on, way out to very far away from your planet, to nearly half or so away across the universe, the current sized one, or nearly that far. Your karmic records that interplay with your life, at the moment, are stored out that far, and we have others, stored and hidden elsewhere, as well, that are just sitting there, waiting to be dealt with. Our placing of your karmic records, along with every one elses, in this manner, deterimines what your karma is.

With this storage method, it keeps your records where we want them to be, for us to be able to determine what your karma is, and for us to be able with my religion, and with your religious activities, of sexaling with your self, with others, and with your sexaling with animals, as sexaling is sexaling, and there is no distinguishing of the effects of sexaling. That is, your sexaling brings you closer to GODLYNESS, no matter if you sexal with an ape, or baboon, or with a monkey, or pet goose, or neighbor, or sister or brother, or your child, or mother or father, or the conductor on the train, or subway, or the stewardesses and stewards in the airplanes you fly in, or on the trains you travel and commute to work in, or on the cruise ships you vacation on, those of you with a little money, or with the workers in the casinos and restaraunts that you frequent, if you happen to live in Las Vegas, or other places where casinos are a part of the local life style, and so forth, with your sexaling experiences of coming closer to GODLYNESS, as you orgasm, and as you pulsate with energies that purify your life, these energies, and other energies my kids have a lot to do with, in the transporting of them to you, during your religious activities, and other things that are like energies that also cleanse your karma, but that need further clarification as to what they are, these energies, etc., erase your karmic records, in a priority determined manner with your karmic records stored in this manner as described. You will learn more about this, in detail, as you begin your studies once you have access to the software package that the FBI, and government agencies are in the possession of, as I've explained about.

For the present, I am stuck in a swamp like sand box, a parcel of land, inhabited by dhourties, who are assasins, and killers for hire, who work hand in hand with the dhourty police, and dhourty members of law enforcement, and their dhourty staff. Dhourty hospitals also work hand in hand with the tunnel rat association of dhourty assasins and killers for hire, and with the dhourty police and their dhourty friends, and dhourty advisors. All dhourties work with one and another, in their local area, and they are generally, well connected with each other, in that local area, but only a few of them know about what is going on, with myself, GOD, and with my battle to over throw the dhourty led governments of the world.

The Dhourties Are Not Informed As To What I Am Doing, And Few Of Them, Know Any Thing At All About Me

There is no TV or media broadcasting about what I am doing, and they only have their 'propaganda' TV to watch and to gain information from, in addition to their 'propaganda' news papers, and 'propaganda' news magazines. They do not exchange much information, as they are prohibited from discussing business, except in the underground 'fortresses', the 'torture' facilities for torturing the dualdigers. Even in those locations, they do not generally discuss anything to do with business as usual types of stuff. Only important topics or issues, such as John Ayres trying to destroy the Lesbianists, or similar topics of importance, are allowed, and not much discussion of any thing of interest, is exchanged by them, even in private. They are busy with torturing the dualdigers, and it is a waste of time, to discuss private, personal, or local issues, and even state or national issues, and they are not allowed by their code books, to discuss 'wasteful' of time, issues with each other, while they are on their tour of duty.

Lewd Conduct Should Be Advanced, Not Prohibited, In A Sane Society

Lewd conduct should be advanced in any society, that has a sane, municipalator, or manager in charge of laws and criminalities, and not 'condemed' as is the way it is handled in this society. This will lead to the detieroration of and the disintegration of human relationships, and it will end all possiblities that people have of attaining a higher standard of spiritual beingness, or spiritual goodlyness engaged in a love relationship with one's creator. The action of sexaling brings about a state of euphoria, but in that euphoria, there is a holyness that is hard to penetrate into and perceive, as sexaling in our demented and twisted minded society, is a condemned activity, and that is clearly brain washed into every one's minds, as that is a propaganda ploy of the Lesbianists, the dhourties. Arresting ladies who sexal for a living, is one propaganda technique the Lesbianists use to alter the minds of people. Christian values, of, sexal only with one's spouse, is saying, you can not sexal with others and if you do, you will be committing a wrongful act. That is also clearly stated in Christian concepts, and it is another brain washing technique, not to mention, a most devious one, that is highly rewarded, with maximum penalties, in my karmic score card approach to managing my universe, and you will learn more about that, when you begin your 'Managing My Universe' course work, and you will also learn about it, as you go along, and learn the principals of my religions, past, and present.

Lewd conduct is not a topic I will discuss with prosecuting attornies, or with DA's, or with judges, or with police, as they are not qualified to say a word about the realm of GODLYNESS, in their inferior roles as varmint hunters, or criminal watchers, and on this planet, as criminal torturers and killers. They are not fit, the Lesbianists, mentally, to judge or determine the value of sexaling. They are so anti-sexaling in their actions and words, and they are so incredibly twisted up in their brains with regards to sexaling, they will never come any where near me, or close to me, not one of them, as they are too twisted in their minds, to be allowed by my children, to come any where near me.

The joke the Lesbianists promote about sexaling, where they publicly condem it, and privately enjoy sexaling with their co-worker dhourties, is a big joke, the dhourties are playing on you, and you are being goof balled, here, as well, into believeing that sexual promiscuity is a 'bad' thing. You are a fool if you believe that, and I am here to change all of that negative thinking, that you are burdened with, that the dhourties have fooled you into beliveing, if you in fact, do believe that sexual promiscuity is a 'negative' thing, as that, as I've explained, is the only way for you to erase your karma, and to ease the burden of karma in your life.

Like it or not, if I had wanted you to wear clothes when you were born, I would have designed your bodies to have clothes on them, when you were born. Your skin is your clothes, and it is only a matter of time before you realize it. I did not design your bodies with any other clothes on them, for your birth, and so, all you need to live in, in moderate climates, is your skin and hair. That is all you need and you will all get used to it, one day, living in your skin, and hair, only, after you begin working for me, sexaling for a living, as I have explained about.

You are all going to work for me, erasing karma, from now on, by sexaling, as soon as I get my religious ministry, established. My kids will be building the facilities for you to live and work in. When they will begin building the facilities for you to live and work in, is the question, that I do not have an answer for. But I am praying, that it will be as soon as possible, as I do not need to be surrounded by dhourty jerks in the park, who call the police every time I arrive to do my Tai Chi aerobics excercises religious prayer ceremonies.

The dhourties in the park, and the dhourties at the police station, and in the Clark County Detention Center, are all partners, who work hand in hand, along with police department, sheriff's department, and other law enforcement clerical dhourties, law enforcement dhourty judges, and prosecuting attorney dhourties. We are surrounded by the dhourties, in government, such as all the politicians running for president, and all the politicians running for vice president, including, former mayor Guiliani, who was with other dhourties, primarily responsible for the World Trade Tower bombing, as I've explained about.

These dhourties, and their dhourty friends, in society, account for a large segment of our society. The ordinary people, for the most part, former Lesbianists, i.e., dhourties, in previous lifes, are another large segment of our population. One other segment, is my, what I call, my public sector service workers, animal people, who eat and torture dhourties, and others, who need their karma balanced out.

The dhourties are well aware of these animal people, and there are some dhourties, who can not function, brainally, very well, and these dhourties who can not function brainally very well, are not that different from these animal people, as they both do the same basic thing, and that is torture people, and torturing people helps to balance out karma.

We are in a new age, the Gurkian Age, and I have a whole new religious program, for balancing out karma, and you will all participate in it, if you want to balance out your karma, and if you want to erase your karma, and you will be in this religious program, for eternity, sexaling with each other, as I have already explained.

Organ Animals And Sexaling

I mentioned the organ animals and their ability to make notational thoughts to your brain. The 'I need sex' 'I need sex' drive in your pants, or panties, on the front side of your groin, or on the underside of your groin, or in your butt hole, the urging out, of 'I need sex' 'I need sex', or in the boobies of women and girls, the urging, 'I need sex' 'I need sex', they are all notational thoughts from the sexaling organ animals in your body. Let's get used to this fact, and grow up, and deal with things, logically. They are calling out for our assistance. They want love and affection. They are hungry for love and affection. I put them in your body the way they are so they will help you in your daily activities of sexaling. Now let's get real, and let's pet those organ animals, when they call out, saying, 'I want sex, please pet me now!' It's be kind to organ animals week, this week and every week from now on, until we learn to be helpful to all of our sexaling organ animals who need petting, and until we learn to be comfortable with our sexuality. Let's get real, and let's get the governments of the world to strike down the laws regarding sexuality, nakedity, and sex between younger people and older people, and let's also get the governments of the world to strike down all the laws regarding the use of opiates, and aphrodesics in our daily diet and in our quest to get healthier. We need these in our diet, as I've mentioned before, and we will push ahead until we get the dhourty governments of the world to listen to us, and then to comply.

All Hands At The Quarter! Ready Your Weapons! Off Shoot Now!

That means, get to your stations, and prepare to fight. Get your weapons in firing order. Discharge your weapons.

That means, get naked, get your dicks, scrotums, your vaginas, labia, all your sexaling equipment, such as your titties, your chests, your pelvises, your hips, your tummies, your groins, your butt cracks, your butt holes, your shanks, your backs, yopur shoulders, your necks, your under arms, your feet, your palms, your toes, your fingers, your tounges, your lips, your mouths, your throats, etc., and get every little or big organ animal in your body that is hiding in you, to work, working for you, as they are all designed and built for you to use for sexaling enjoyment, and that body you are in, is designed and built to be used for sexaling with your self, with others, as well as with animals, and get ready to use them, and get using them, now.

Keep Firing Till Ordered Otherwise!

That means, do not stop sexaling, till you are ordered to.

Captain Off The Bridge.

Eyes, Ears, Noses, Throats, Tummies, Buttholes, Dicks, Vaginas, Expeller Ports, And Who Knows What Else, Oh My! - Subtle Ways Of Brain Washing People - What Is Sodomy? - Societal Brain Washing - Hair Ports - Teeth Ports Updated: 11-08-07 Rev.b 05:50

Eyes, Ears, Noses, Throats, Tummies, Buttholes, Dicks, Vaginas, Expeller Ports, And Who Knows What Else, Oh My!

Did you know that we have lots of organ animals inside of us? We do. And do you know what else? Each one of them, has its own brain. It has lots of brains inside of it, and each one does a particular function, or maybe many functions. Probably lots of functions, I suppose. In any case, each one has eyes, and each one has a nose, one or more, and each one has a mouth, and each one has ears, and each one has a throat, one or more, and each one has a butt hole, and a dick, or a vagina, or maybe both, or maybe something in between, or maybe, some thing that is not like a dick or a vagina, and is not in between, but it is some thing that is wholely and entirely different from any thing we are familiar with as far as reproductive organs go.

They also have tummies, and expeller ports, which are ports or openings, that help them to expate the juices that there are inside of them. What does expate mean? I think it means, to spit out. They expate, or spit out, all kinds of juices, from lots of expeller ports, or expeller opening holes, that open and close, and when they open, juices come drooling out of them, and when they close, the juices stop coming out, and the fluids drool and drain off and go some where, such as down a via duct, or a channel, and out into a pool, where there are animals, swimming, and snorkeling, and looking for food to eat.

Anyway, it's a confusing world, inside the body, if you don't go into it, and look around for your self, at all the possible hiding places, there are animals hiding, and eating up one and another.

We can look inside, and that is much safer, with microscope technologies that will allow us to look inside, into all the different habitats that there are, where animals are living, eating, making children by themselves or with others who are like them, and so forth.

There are all kinds of odd creatures living inside of us, and we haven't even begun to understand who is in there, and what they are all doing. I think we need the cooperation of the governments of the world, the dhourty governments, that I've explained about, and when they give us a little cooperation, we can build the types of microscopic technologies we need to look inside of our bodies, and see all the little animals that are moving about, and eating, drinking, swimming, fooling around, walking around, and just playing around, or making love with one and another, to make babies.

Did you know, too, that there are optical nerves, that are a little like optic fibers, and they connect many of the organ animals inside of us, up to optic cirtcuits that then allow them to see out side of our body.

That means, they can see the world around us. Did you know our whole body is covered with microscopic, and smaller, optic ports, or viewing windows, and viewing ports, to allow the organ animals inside of our bodies to see out side the human body.

It's true. There are also nerves that are channels, like optic ports, but they are sensory ports of different kinds. These sensory ports also connect the organ animals up to the skin of our bodies, so they can smell the fresh air around us, and these sensory nerves act like little noses, and they are all over our body, in smaller than microscopic sizes, as well.

There are also sensory nerves that function as ears, for the organ animals, and they are connected up to the skin of our body, so that the organ animals can hear things, that are going on, around us.

There are other sensory nerves, that connect organ animals up to the surface of our skin, and these sensory nerves, allow for communication with other organ animals in other people's bodies.

The organ animals all see each other, the outsides of each other, and they can even see inside of your body, with special heat wave signatures, and other technologies, that allow them to peer inside of your body, and then see their organ animal friends, more up close.

That means, they can see each other, and they can talk with each other. They have sensory nerves that transmit code to the special ears of the other organ animals who they wish to speak with, and the special ears of the other organ animals pick up different frequencies, and different coding structures, and then they can communicate back and forth with each other.

You didn't know that, did you. Well, it is a secret the Lesbianists, or dhourties, do not want the dualdigers to know about. Do you know why? Because, their Christian bullshit is just that. A pile of bull shit. Not only that, but their sciences are all full of shit, too. If you know that there are organ animals who want to see out side your body, and view and communicate with other organ animals, who are in other people's bodies, then you will want to allow them to hear as best as they can, and you will want them to see as best as they can, and you will want to let them smell the fragrances outside your body, of other organ animals, as best as they can, and so forth, and that means, you will want to take your clothes off to allow them to see outside, and hear outside, and smell outside, and speak outside to other organ animals, with no interference from your clothes, and skirts, and pants, and underpants, blouses, bras, shirts, socks, shoes, jackets, handbags, brief cases, and so forth.

You would want to stay naked, as much as possible, because that was how I designed you to be. Did you know that? Well, it is true. We have to let the organ animals inside of our bodies get as much fresh air, and as much sunlight, and as much sensory input as possible, from the outside world, and from other organ animals, for them to be happy, living and working where they do, inside of our bodies.

Does that make sense to you? I hope it does, because we are all mistaken in our beliefs that we must wear clothes.

Nudity promotes the health of the organ animals, inside of our bodies, both mentally, emotionally, spiritually, and sexually. They get turned on by the fragrances of other organ animals, and by the sights as they look at other organ animals, working in your body, and at the figures of other organ animals, and at the sexy looking sexaling ports, or dick and vaginas, of other organ animals. They are like puppy dogs, in a way, but much more complicated, and much more intelligent, many of them, any way.

They have complicated code structures, that allow them to speak back and forth with other organ animals, in ways that allow them to tell jokes, and to tell funny stories, and to sing songs, and to teach other organ animals who are like them, about things they know about.

Not many of you may know this, but all the dhourties know this. They have to keep it a secret from you, so that you can continue in your ignorance, thinking you are 'created in the likeness of god' which is total bull shit and trash.

Well, now that we understand that much, it is time to investigate and get this all cleared up. Now how do we investigate this? I don't know, but maybe when we get the cooperation of the dhourties in government, we will get some software from them, the software that I handed to them, or the software that they have hidden away in secret filing cabinets, which they can allow you to use, to see inside your body, and investigate all these things.

Do you think the organ animals like being trapped inside of your body, unable to see out side, or hear outside, or speak to others, outside, because you live so far away from each other, and you live in tiny boxes, homes, or houses, or apartments, and condominiums, etc., where you live by your self, separated from others.

I don't think they are very happy that you are all living in your tiny boxes, which serve as homes for you, where you live by your self, much of the time, and you pay no attention to the needs of the organ animals.

They need light, sun, shade, coolness, brisk breezes, and the scents and smells of other organ animals, and the nearness of others, to them, so they can communicate and chat back and forth with their friends, the other organ animals in other peoples' bodies.

You need to marry each other in large groups, in other words, and you need to stay togehther in large groups, and you need to be naked, twenty four hours a day, in large groups, and you need to go out side and play naked, in the sunlight, with others in your groups, and with others from other groups, to allow your organ animals to get all the opportunities to meet with new people, other organ animals, who are as intelligent as they are.

Did you think you were the only intelligent people in the whole universe? Well, some of my organ animals are almost just as intelligent as you are.

In some ways, they are as intelligent as you are. Did you know that? How does that make you feel. You have a cooped up organ animal, lots of them, inside your body, who you do not even know about, and they are all wanting to make friends with other organ animals, and they are all wanting to meet with other organ animals, while they work for me, and for you, inside of your body.

Well, the little secret of the dhourties, this one, any way, is now out and open to the public, and you can make of it, what you want, and you can either research it, and learn about the facts of this, or you can deny it, in ignorance, because you think 'Jesus saves' and you think 'god' or 'allah' is going to make you a nice home, after you die. What garbage talk.

The dhourties have made you swallow their garbage talk, all this time, and they have been fooling you, and they have been rejuvenating their bodies, and then playing as if they were some kind of watch person, or care taker, who could decide your futures for you.

Well, I don't think Hillary Clinton, or Barack Obama, or any of the other dhourty government leaders who are running for a presidential candidacy, or for a vice presidential candidacy, is going to like the news that you now know what is going on, a little more than before, inside of your body, and that you are about to reject their religious garbage talk, and all of their sciences garbage talk, and all of their statutes garbage talk, that help to keep you in check, and in line, and that keep you going, working and growing older, day after day, paying the taxes for maintaining their livelyhood, while they have a way to rejuvenate themselves, as professional moldists, and while you have nothing, other than a token watch for working thirty, or more years, devoted to the company, before you were released from work, with a meager pension, to find a grave yard plot, for placing your bones in, after you die, and go back to my Epcot Center, for refurbishing, and for making you as good as new, nearly, for your release as a new tummy baby, back to one of your former neighbors, or former relatives, as a new baby.

Isn't that about the stupidist thing you've ever heard of? And isn't that a joke. Well, they get away with it, every day, and the dhourties who support them, organizationally, are in on it with them, and none of them deserve much of a nice smile, or any thing else, for that matter, for all their mean jokes and tricks that they have played on you.

That means, go right ahead, and kill them all, as I do not care any more, about any of these dhourty kids of mine, unless they are willing to cooperate with all of my dualdiger kids. Do you understand that? Go to the dhourty courthouses, and blow them up, and go to the police stations, and jails, and prisons, and blow them all up, and medical hospitals are other big places which dhourties like to torture dualdiger kids of mine, under them, and even in secret rooms, in them, and so are universities and colleges, and large schools, and low income housing projects, government buildings of all kinds, and blow all of them up, along with the Pentagon, Fort Knox, and so on.

We have to get the dhourties in government to cooperate, and to do that, we need to send them a message. So if you wish to blow Washington, D.C., out of the surrounding area, and level the white house, and every one in it, then go right ahead. You have my explosive formulas, on my bulletin board, so go right ahead, and do what you think is right.

Now, we need the cooperating dhourties, to tell us every thing, and we want them to cooperate with us, as quickly as possible. Are you listening, Mr., And Mrs. Dhourties? You had better be, as some people may not like you, very much.

girls and women who had your dicks cut off, before you were old enough to say whether you wished to have it on your body, or not, which is kind of a nutty thing to think about, as of course, you would want your hands attached to your body, and of course you would want all your limbs attached to your body, and the dick is just another limb, but it is a very important limb, because it can help you to draw closer to GOD, that's me, as you sexal with your dick, you girls and women, who had your dicks cut off, you can eventually grow them back, as I've explained about, before, using tissue and organ regrowth molds and foods for the molds, which will make the organ animals begin to make babies, so that your dick grows back, eventually. It may take some time, but little by little, it will grow back. The dhourty girls and women, who come out for a tour of duty, always have their dicks cut off, so that they can fool people into thinking that they were not born with a dick. It is one of the Lesbianists' rules that they cut their dicks off, before they come out for a tour of duty. Ask one of them, and you'll see that I'm right about this. They grow it back, once their tour of duty is up, and once they have a suitable place to live, where they can live for the next, few thousand years, while their bodies repair them selves. It takes a few thousand years for a dick to grow back, completely, or nearly that long, but once it grows back, it is usually as good as new. Seldom is it not good as new, and only if the person has some kind of karmic problem, will it not grow back, perfectly. That's very seldom, but it does happen. You can try again, after you sexal a long time, and you will be able to erase your negative karma, that keeps you from having a perfectly formed dick to sexal with, if your dick does not grow back, perfectly, the first time. In time, after you erase your karma, enough, your dick will begin to shape up into a perfectly formed dick, but it takes a long time, to get it perfect, so don't worry, as we will be here, for ever, and we will be sexaling for ever, as this is a new age, the Gurkian Age, and we are going to be sexaling for ever, from now on, all of you, and me, too.

Societal Brain Washing

These tricks with words the dhourty kids play on us and use in the media, is societal brain washing, and there are other types of brain washing they use, such as in sunday school, by saying 'the lord said that you should be chaste and love only your one wife' or something to that effect, or that 'you should love, have sex, and have children with only your "legally married to you and sanctioned by the government, and here is a piece of paper to prove it" husband'. Well, there are still other ways of brain washing you, by showing you how in muslim countries, how strict people are about sexing with others who they are not married to. This is subtle brain washing they use in the media to try and scare you into following the rules they set up for you to follow. They think you and I are fools, and that you and I will not question their authority, but that is now all coming to an end. That means, it is the end of an age, a long age, from the very begining of our time in this universe, and we are starting a new age, the Gurkian Age, and we are going to start all over, and right all the wrongs, and get every thing corrected that needs correcting.

When you live a healthy life, with full nakedity, daily, every day of the year, you begin to charge up the organ animals, inside of your body, and when you live and work with others, in large groups of people, who are also naked, twenty four hours a day, seven days a week, you and they all begin to get charged up by your organ animals. It is no secret, that if they feel good, then you feel good. If they feel invigorated, and sexually charged up, then you will feel invigorated, and sexually charged up.

What fools we are, not to know this. I don't mean, you, my dualdiger kids, but it seems we should all know this, as it would be common sense, if we were taught this in the public school system.

We are not given the chance to know about this, as the dhourties are all too secretive, and they like feeding us their garbage talk, their school teachers, and their professors, and their sunday school teachers, and their law enforcement workers, and their judges, and their government administrators, and so forth. I think we should get rid of them all, and start out, fresh, but that isn't the way to go, as we want to get them to cooperate with us, and to do that, we need to invite them into your homes, into the play time dungeon cells, where you can have them teach you all the secrets to sexaling, and all the interesting information on living long, and prolonging our lives, with molds, and foods for molds, that feed our organ animals, and allow us to live forever as the organ animals, reproduce, as well as the secret about where we can get spare body parts from, which is from the sexaling juices of men and women, and even animals.

Well, it is about time, we started to find out the truth about all of this, and if we do not get the cooperation of the dhourties in government, pretty soon, there are going to be a lot of angry people, pretty soon, as word of all of this, begins to spread from person to person, as the dhourty news companies, the brain washing media companies, with their bullshit news stories about 'incest' and about, 'lewdness', and about, 'prince charles and his latest secret sex scandal', and so on, all the petty bull shit garbage talk they make us swallow, as interesting news stories, which secretly send messages to our brains, that sexaling is a 'no no', and that is total garbage talk, but we are influenced to believe that sexaling is a 'no no' by subtle means, every day, over the air waves, on tv, in the news, and in the mass media print, in the news papers and news magazines. Well, it is time to burn the 'Inquirer' down, and blow their basement up, as well, as they no doubt, have the same kinds of torture facilities for torturing dualdigers, under them, as well.

Hair Ports

Where else do the viewing ports, or optical ports, and the other ports for sniffing fragrances, and for hearing sounds, and for hearing various coding frequencies, that the organ animals communicate back and forth on, exist?

They grow in nose hair follicles, eye lash follicles, eye brow follicles, nose and throat hair follicles, stomach hair follicles, intestinal skin hair follicles, external skin follicles, head hair follicles, facial hair follicles, leg, arm, and body hair follicles. The sensory ports grow along with the hair follicles, extending their way up the hair shafts, and to the surfaces of the hair follicles so that they can pick up the light waves, and various energies waves, for sounds, and for colors, hues, textures, texturing hues, light and grey, dark and white, prisms, or prismatic colors.

The organ animals transmit in not only sound orientation patterns, but also in light wave frequencies patterns. There are many energies wave forms that they can transmit and pick up, and the multitude of variances and types are far greater then we are aware of. The organ animals can transmit off and send out various frequencies, with various tonal orientations. They can transmit in light wave energies codings of various shades, colors, hues, textures, and patterns. The variety is nearly limitless, and it will take you a long time to study about all of them.

There are odors that they can pick up, and there are odors that they can generate, when they are healthy. They are not healthy, unless you feed them, correctly. If you do not feed them the foods that they like, they will not send out any special energies wave forms, or even odors, or much of any thing else, as they are starving, and have no way of supplying the needed nutrients to the internal organs of the organ animals, for the internal organs to produce the energies needed, to transmit and send signals out in.

If you do not feed the organ animals the foods they need, they become pathetically weak, and they will barely do any thing, at all, in terms of communicating with other organs animals.

If the organ animals do not communicate with other organs animals in our own body, and in other people's bodies, they can not meet and talk with other organs animals, and they can not sing to each other, and they can not give off the scents and odors that signal health and well beingness and that bring cheer and happiness, and vital energies to each other, as they sexually arouse each other, and that in turn, sexually arouse us, as a spin off of their good health, fitness, and well beingness.

They are stuck in a pathetically weak physical condition, all their life, narly starving to death, because of the poor diets we are encouraged to eat, that do not give them the nutrients they need to get healthy, and fit. The pitifully poor in nutrients foods such as corn flakes, or cheerios, raisin bran, total, and so forth, manufactured by Kellog's or Proctor and Gamble, General Mills, Quaker Oats, etc., and all the other, pathetically nutritionless foods that the major and minor dhourties' foods manufacturers produce, that we eat, day in and day out, do nothing for the health and welfare of our organ animals, and these foods barely keep us alive, nutritionally speaking.

The organ animals, when healthy, can use all the possible transmission frequencies that are available to them, to speak to others, and to communicate with others, and to begin to have a good time, in life. They deserve to have a good time, in life, just as your pet dog does, and just as your pet parakeet does, and just as your pet cat or ferret does.

We can not starve these animals inside of our bodies, which is basically what we are doing, at the present. We can not deny them a view to the outside world by covering up our bodies with clothes, women's and girls' faces with veils and women's and girls' hair with scarves as in the middle east, and with face powder and mascara, as is the tradition in the west, and in some eastern countries.

We can not deny the organ animals companionship with others of their species, if you can call it that. They are living beings, and they are creatures. They are breathing, and alive, and they wish to be fed, and they wish to stay healthy, and they wish to meet others, and they wish to be able to communicate with others, and we deny them those rights of theirs, and others of their rights, because we are ignorant as to the fact of their existence in our bodies.

This is obviously a conspiracy, if you haven't figured it out, by now, and we have to put a stop to it. We also have to educate our selves as to how to feed them, and how to properly feed our bodies for maximum nutrient intake to the organ animals, that are the basis for our physical, mental, emotional, and spiritual well beingness.

In time, we will learn more about all of this as we get the cooperation of more and more of the dhourties, who are willing to cooperate, and who are willing to teach you, my dualdiger children, about all of this. I am GOD, and I am your mom and pop. I can call you my children, and I can call my dhourty children, my children, and you had all better get used to it, as now and then I will address all of you as my children, whether people like it or not.

I've got lots of children in my universe, and some of them look like fucking apes, and some of them look like fucking monkeys, and some of them look like ostriches, and you won't believe the mutataions they have gone through, some of them, and actually, lots of them. Many of them are mixed mutations, that they have gone through, and lots of them look nothing like any thing you've ever seen before. They are gruesome looking, and scarisome, and you would not like to meet them, guraranteed, as they will tend to eat you up, if they can. It's the result of their karma, and it will be a long time before we erase eneough of their karma to make a difference, so as to bring them back to a form that is close to or similar to what a human being looks like, for us to then mix with, marry with, and sexal with. You were all the spouses of each other, from way, way, back, and you will be the kids of mine, and you will be marrying each other, again and again, as there is no limit to the number of times you can form a parental union, and that means with more than one spouse in tow. You can form parental unions with more than one spouse, and there is no limit, practically, to the number of spouses you can have, male and female, at the same time.

I'm not sure what the limit is, but it is a working number of people, and that means, any where below a few trillion, or maybe even a few more. You can have nearly an unlimited number of spouses, and that's probably more like it, but the trick is, how do you manage all your spouses, that is, how do you serve and protect, and sexal with all of them, when the number grows over a few million or more. Well, it takes time, and experience to teach you that, and you'll learn all that, in your courses you'll be taking, when you start up studying, and participating in the programs that I and my children have planned for you, once we get a little further into the Gurkian Age. We are still in the preparatory stages, of my religous revolution, and soon we will be getting past the preparatory stages, and how soon, I can't estimate, but obviously, we need the cooperation of the dhourty governments, and of the dhourties to begin to get any where.

Teeth Ports

We have teeth and finger nails, and toe nails that also have optical ports, and other sensory ports in them. Of course our animals inside of our teeth want to make friends with other animals inside of other people's teeth. There are also many other animals inside of us who can use the viewing, or optical ports inside the teeth, and in the finger nails, and in the toe nails, for viewing outside of the body, and for looking at other animals in other people's bodies, and then for communicating with those animals. All these animals are organ animals, and they are on the job, twenty four hours a day, seven days a week, and they barely ever sleep. They like to make contact with others of thier kind. I don't know if 'species' is correct, but they are all my worker animals, or in this case, worker organ animals. They need respect just like your puppy dogs and your cats and your parrots do, if you are a normal human being who respects other living beings. Well, any way, lots of these organ animals inside of us, are very clever, and much more clever than we are, in some ways. You can study about them and how they communicate with each other, and how they have fun with each other, once we get the educational materials that I handed out, to the FBI, and that was passed on to the governments of the world, as I've explained about, before.

We probably should not cover up our faces with makeup, because that makes it hard for organ animals to see out side into the world around them. It also makes communicating difficult, when we put on face makeup, that is, when women and girls put on face makeup, as that gets in the way of the optical viewing ports, and it gets in the way of the ear ports, the hearing ports, or the incoming signals ports. Also, finger nail polish and toe nail polish is of course, obstructive, and it prevents the organ animals from communicating out and it prevents the organ animals from recieving incomeing light wave and signals waves transmission signals that depend on your having clear and not painted toe and finger nails. Hair coloring in women and in men, and beard coloring in men, is also obstrutive, and it prevents the incoming and out going signals, and is just as bad as nail polish, and makeup, or face veils, such as they wear in the middle east, and scarves over the hair, which women and girls in the middle east are also forced to wear. It's not fair, what is going on. We are being suppressed by our dhourty friends, who do not treat us very well, aren't we. We are being told how to live our lives, and it is all totally fictitious, and made up, it's a fairy tale dream land they have created, with artificial rules, and artificial religious beliefs, and artificial laws that mean nothing, when we look more closely at them, such as the 'lewdness' laws, and the 'incest' laws, and the 'nakedity' laws, and the 'no public sexaling' laws. It's all foolish dribble drabble, or nonsense, they made up, from their not so smart, brains of theirs.

Well, anyway, we'll get it all straightened out, one day, soon, I hope. Until then, let's talk with our friends, and tell them about all of this, and see what wild kinds of parties, you can begin to have with your friends, all naked, and having fun with each other. Invite your dhourty friends, too, because they have a lot to teach you, and if they do not wish to come, then maybe you should ask them why? Usually, they are older, as not many of them can rejuvenate themselves to look much younger than eight or nine years old. Some girls, though, they may be able to rejuvenate them selves to what would appear to be a four year old, if their bones are small enough. In some Asian countries, some girls may look even three and a half years old, because they are so tiny, some of them, and their bones are very small. The smaller your bones are, the younger you can make your self look, when you rejuvenate your self.

Captain Off The Bridge.

Dick and Cunt Animals, And Other 'Sexaling' Organs Animals

Dick, scrotum, and cunt animals, and boobie animals, and breasts animals, and butty butt animals, butty butt hole animals, groin animals, underarm animals, and every organ animal in your body, they do not like you to wear clothes.

Organ animals like to be able to smell the odors around them in their environments, and that means, the odors on the outside of your body, as well as the odors on the inside of your body. There are noses, or odor sensors on the outside or skin of your body, and on the surfaces of the hair shafts, finger nails, and toe nails, odor sensors that function as noses, as I explained. The tiny organs animals in side of your body, as well as the big organs animals inside of your body, they all have noses attached, or odors sensors that function as noses, to smell the odors, in the atmospheres, around them.

The organs animals inside of your body, as well as your dermal skin organ animals, hair organ animals, teeth organ animals, bone organ animals, sinew organ animals, cartiladges organs animals, ligatures organs animals, and so forth, they all get a better sense of what is around you, if you do not wear clothes. They can smell or sense the odors of other people, and the odors of the organs animals inside of other people, that are in the air on the outside of your body, that drift in the air, from the ladies' bodies organs animals and from the mens' bodies' organs animals.

Incompatible Fumes Animals

The organs animals of your dick, cunt, groin, breasts, hips, butt, legs, and so forth, all enjoy the odors of other people's organs animals. If you leave your windows open, in the day time, and at night, and bring in the fresh air of the outside with the odors of kids, girls, boys, men, and women, and if you take your pants off, and underpants off, and your shirt or blouse off, and socks or stockings off, as you get healthier from a proper diet for feeding your organs animals, and for feeding you, as well, when your organs animals become healthy, they will perk up right away as they sense or smell, the odors of the kids, girls, boys, women and men, and elderly people, who are in your neighborhood, walking by your home, or by your apartment, daily.

The odors of other organs animals, such as those of dogs, cats, birds, and other animals, are all good for the health of the organs animals inside of your body and they perk up the organs animals to some extent. The best compatiblities of organs animals, such as mens', womens', girls', and boys' organs animals, perk up the organs animals inside of your body, and inside of your dick if you are a male, and inside of your cunt, if you are a female, and all of your sexaling organs animals, the most.

All animals, big and small, all have organs animals with similar shapes, and all the organs animals come in different sizes, and they all give off wonderful odors that stimulate your organs animals appetite for enjoyment, and for fun, and entertainment.

Organs animals get their entertainment communicating with other organs animals, and by exhanging odors and messages of various kinds, and singing and talking, and if they can not smell or sense other organs animals, because you are always wearing clothes, and if they can not see them, or hear them, your organs animals and you will slowly perish, and their interest in living, and your interest in living, will slowly diminish, and they will grow sad, and you will also grow sad.

The poly carbonates plastics and fumes animals' smells, and the over powering, over whelming poisonous fumes animals that mess up the smell sensing of the organs animals, and mess up their brains, bodies, and nervous systems, will cause the organs animals to lead sick, lonely, unhappy, tragic lives, and they will slowly die, as they get eaten up by fumes animals from gasoline, car exhaust, industrial pollution, plastics, nylon carpets, polyester sheets, polyester blankets, nylon and polyester clothing, polyester pillows, nylon stockings, polyester and nylon panties of women, polyester and nylon socks and underware of men, and as they get eaten up by other incompatible fumes animals from the chemicals industry, and from the petro chemical industry, and from the brewery industry.

I've mentioned, before, store bought whiskey, gin, vermouth, and so forth, all have various types of alcohol in them, that are made from different processes, from the petro chemical industry and from the chemicals industry. That poison but drinkable alcohol is blended in with naturally brewed, normal, drinkable whiskey, or other alchol beverage, and then sold to the public to drink. Apple cider vinegar has one type of this poison but drinkable alcohol in it, and wines, beers, and liquors all have poison but drinkable alcohol of different types, in them.

Organs animals do not like to smell or inhale, or sense, the odors of the poly saturates plastics animals and the odors of the plastics animals' relatives from the chemicals industry, and from the petrochemical industry.

Organs animals prefer the odors of cotton, and wool, and of natural fibers from plants, and odors from fibers from animals, and organs animals get sick if they are forced to sense the odors of the poly saturates plastics animals, and other related animals, from the two industries, mentioned above.

If organs animals are forced to inhale, or sense the odors of these plastics animals, and fumes animals, that are incompatible with human beings, they get sick, and they die, eventually, from sensing them over too long a period of time. It is not good for them, and it is not good for their nervous systems, and the fumes are not good for you, either. The plastics and other detrimental fumes animals, find the organs animals, tasty, and they eat them up, little by little.

Your body gets eaten up, little by little, by these incompatible fumes animals, who eat up little and big organs animals, and then poop and pee out all kinds of petroleum related substances, and other harmful chemical substances.

These worsen the health of your organs animals, day by day, hour by hour. One day, your dick or your cunt, will not wake up, any more, as you grow older in age, and it is because your organs animals in your dick, or in your cunt, have been too seriously damaged by all the incompatible fumes and other animals, that eat up your dick organ animals, or your cunt animals, and you loose the sensitivity, and you loose the organs animals that provide juices of various kinds, to provide your body with aphrodesics animals. Your desire for sexaling begins to fall, as you grow older, as a result, and you loose your interest in sexaling.

The butthole organ animals hold out longer than the dick and the cunt organ animals, and the titty nipple animals, lips animals, and other organs animals needed for sexaling with each other.

That means, your dick may be of no or of little use, or your cunt may be of little or of no use, but your butt hole, and your shank, are doing, better, perhaps, depending on your diet. If your diet is filled with foods that are loaded in preservatives, iodized table salt, petroleum tainted sugar, and or sugar tampered with by the use of many other unhealthful to humans animals, and if you eat a lot of fast foods, or foods made for you, such as precooked meals, you serve from the freezer, for a fast warm up in the micro wave oven, which adds more unhealthy animals to your diet, by the way, your organs animals may not be in very good shape, in your mouth, throat, tummy, shank, and in the butt hole.

Micro wave, by the way, leaves lots of animals of various kinds, on your skin, just like the sun light does. The micro wave animals, get together with other animals that should not be on your body, and which should not be in your body, and they start breeding, and feeding on each other and feeding on your body, and they begin making a nice home of your body, and later in life, your body will erupt in a catastrophic destruction, when all of a sudden, your whole body erupts with countless, incompatible animals, eating up your body organs, inside and out.

Preventing Body Melt Down Tragedy

Molds animals, and funguses animals, and ocean salt, and raw, pure sugar, and other nutrients, will help your body to over power all of these incompatible animals, and the incompatible animals will eventually all get destroyed if you are diligent and make sure that you eat the types of molds animals, and funguses animals that are needed in your body. You can learn more about this, when you get the software package from the government, as I've mentioned about, before, or when you make friends with a dhourty, and learn from him or her, as

I've mentioned about, before.

The Dhourties never mention this type of outbreak of animals in peoples' bodies that eat up their bodies, all of a sudden, on the TV or in the news papers, as a person who has an outbreak is too grissely to look at, and the person smells, terrible. It most often occurs in the elderly, and the elderly are hidden from others, and no one in the general public ever sees the elderly when their bodies begin to get eaten up by these animals. It can happen to persons who are not elderly, if the person is exposed to dangerously high levels of toxic fumes animals, and other incompatible animals, on a daily basis.

The person's body, melts, and sours, and becomes greasy, as the organs animals are all being eaten up, all of a sudden. It often starts on the head, as it erupts on the scalp, or on the face, hands, feet, or skin. Lots of these people live in side their homes, and never come out, as they look and smell too awful, as they slowly die. Many times, when a person at home is sick, after an eruption begins, a family member or friend will often times shoot the person, or assist the person with a suicide, as the person is too horrible to look at, as he or she begins to melt, and as the person begins to smell awful.

Often times, if the dhourties get to these people, first, the dhourties transfer these people to the torture rooms, below hospitals, and below prisons, and below, welfare housing projects, when they find them.

Keeping People Alive To Torture Them

They then use their technical know how, to preserve the decaying person, as he or she is being eaten up, and they extend the life of the person, with their medical sciences know how, and they do peculiar things to these people, and turn them into people who never die.

The brain does not die, easily. We think it does, but it does not die, if you place it in a bottle of formaldehyde, or in a bottle of rubbing alchohol. You can place nutrients for the organs animals to eat, and they are just like fish, with the right combination of nutrients mixed in the solutions. The brains do not die, and they are alive, and that means, the person is alive.

They do not need to breath. We and our four legged animals, and two legged birds animals, need air animals and various gasses animals, that carry in lots of useful substances, that mix in with our blood, and then carry the useful substances around the body, bringing them to the organs animals, for them to absorb through their bodies, through tiny little pores, and openings, that the organs animals can suck in the fluids through. They also expell the fluids, once they have absorbed the useful substances they need to keep them alive.

If you place a solution that has all the needed ingredients into it, and then force it into the lungs, the person will no longer need to breath, air and gasses, animals, and they can live almost indefinetly, though it is a very cruel thing to do to a person.

They do not feel well, and they can no longer talk. They do not like it, and they begin to hurt, all over the body. They will, however, stay alive, and then as they stay alive, the dhourties torture them, futher.

They do this to elderly people, all the time, when elderly people, begin to decay and degenerate into a blob of oily substances, that smell very foul.

Of course, no one is going to tell you about this in a medical journal, as it is a trick or prank, the dhourties use, as they like to torture, dualdigers, if they can get a chance to torture them.

If you walk around with no clohes on, the organs animals in your body, will perk up, and they will begin to feel better. If you feed them properly, with molds from breads, and with the foods the molds animals like to eat, such as beef, ham, fish, foul, eggs, corn, cheese, yogurt, milk, cream, spagetti, linguini, pizza, breads, peanut butter, jams, fruits, vegetables, nuts, and so forth, and then poop and pee out, you will make your organs animals diets, much more healthful to them, and they will return to active duty, for you, and they will begin to work for you, as they are very intelligent, almost like people, many of them, and some of them are even better, or smarter than people, such as your brains organs animals, and your nerves organs animals, many of them, and lots of other sense organs related organs animals.

The brains and nerves, and other related organ animals, and also, some other organs animals, besides them, make it possible for you to think. If we didn't have them in us, in many different places, throughout our entire body, we wouldn't be able to think, and we wouldn't be able to do any thing, such as walk, talk, shake hands, eat, pee, poop, think, sense things, make love, sexal, and so forth.

Natural Plant Fibers, Fur Fibers, Clothing, And Cloth

We need to be allowed to walk around, and live with no clothes on, when we can. If it is too cold, we need to keep our selves warm, by dresssing in compatible clothes materials, such as cotton, wool, fur skins, and clothes made from various plant fibers such as hemp or jute fibers, coconut husk fibers, cotton fibers, wood pulp fibers, heavy, fiberous leaves fibers, reed fibers, root plants fibers, tuborlongs fibers, and soy bean husks fibers, and barley husks fibers, rice husks fibers, corn husks fibers, and various other plant fibers, that we can plant, grow, harvest, and then mix and match with compatible fibers for making the clothing to keep us warm, or to make the clothing, we like to dress up in, and go out to the movies, or to the theater, or to go shopping, to school, or to work in.

You can also harvest natural fur fibers from chipmunks, squirels, deer, elk, antelope, goats, cows, horses, donkeys, mules, and from bears, ducks, chickens, parrots, swans, flamingos, sea otters, oselots, dogs, wolves, dingos, kangaroos, koala bears, and from other animals. These fibers, once you harvest them, and process them, with patented technologies, the Dhourties, hide and conceal from Dualdigers, can also be used to make cloth, and clothing materials.

The dhourties and others, know about the technologies needed for making natural fibers cloth from leaf fibers, and from wood pulp fibers, and from fur fibers, but the dhourties do not allow people to make these types of natural fibers cloths, as they are too healthful for you to wear and use in your daily life.

Many people need not wear anything, when the climate is mild, and warm. If it is rainy, they need some protection, maybe, from the water falling, to keep their hair dry, and to keep them feeling comfortable. After the rain is over though, the clothes, such as a poncho, or rain jacket, can come off, and your body's organs animals will be able to smell, or sense, the fresh odors after the cool rain shower.

The dhourties do not want you to walk around, naked, as they know that your health will improve. They also know that your animal organs and their health, will improve. When the animals organs health improves, they will be able to become more active, and that will make you more healthy, the more active, and the more interested in life, and in living, they become.

The dhourties made up the fictious bible stories, and they made up the fictitious islamic, judaic, and christian creation stories, and they made up the evolution stories, as well, and they try to make it seem that the bible is the source for morals, and the bible says that butt fuckaling is wrong, and that sexaling with other persons, other than for making children with your wife is wrong.

People Living Inside Of Our Planet

They then based a whole culture, every culture on this planet, nearly, on fictitious myths, and untrue stories, to keep people from enjoying sexaling, because they say, the dualdigers make too many babies, and if they are not stopped from making babies, they will over run the dhourties, as there are ten times the number of people on this planet, than I originally estimated, which was in the area of nine billion or so, to eleven, thirteen, or fourteen billion. There are ten times that many people on this planet, and there are lots of people living inside the planet, we do not know any thing about.

How Do Volcanoes Work

Volcanoes have a heated mass of easily melted rocks materials, and that pools in a tube, in a 'beaker' like tube, and it swishes around, as the earth turns, and it gets hotter and hotter, and the crumbling mass of rocks, melt down, and they swish around in the bottom of the 'beaker', and every where else, outside the area of the 'beaker' stays warm or cool, and the futher you get away from the 'beaker', the cooler the rocks get. We have people living in the core of this planet, we know nothing about. We have other people, living in other areas of the sub surface areas of this planet, and we do not know any thing about them, either. They all arrrived here, as members of the sexaling for a living outbound expedition new planets settlement programs, from many other planets in our universe.

The dhourties do not like us to make children, and they want to keep us impotent, and they want to keep us separated from each other, and they want us to keep on our clothes, so that our organs animals will not feel good, as they choke on fumes they inhale, or sense, and as they die, from early childhood, on upwards to our old age. We will have less interest in sexaling, as a result of the lower sexaling interests that we have, as we grow up, from fewer and fewer healthy organs animals, and this keeps the population of the dualdigers down, and they think they have a right to do this to us.

They have too many people on this planet, to keep them busy, tortureing, daily, and they do not want any more people on this planet, as they say it is enough to keep them busy, as they work, torturing them. The dualdigers, that's me, and people like me, who can remember their relatively recent birth date, usually people who are less than one hundred and ten or twenty years old, come and go, and come and go, as tummy babies, and then, as we grow old, we die, and we go back to my Epcot Center, for a short stay, until there is a new tummy mommy and tummy daddies, who help the tummy mommy have a tummy baby, and back to this planet, you or I, or some one, else, comes.

Fictitous Religious Ideas And Fiction Based Social Customs, Taboos, Societal Rules, Legalistic Laws, Codes, Regulations, Prohibitions, Punishments, And Penalties

The dhourties have built our societies around the world, based on their written documents about fictious biblical persons such as 'Moses' and 'Abraham', and 'Jesus', and about the fictitious statements these people supposedly said. These people, 'Moses', Abraham, Jesus, and others, did not do any thing, other than live as dualdiger peasants, in the middle east, the mythlogical land of 'Judea', the land supposedly promised by god, to give to the Jews. They made fictitous statements up, fairy tales, for each religion I orginally taught, and they tore out and threw away, all of the orginal teachings, I had left behind, in all of my teaching my religions, lifetimes, and there were a lot of those life times, and I taught a lot of religions. The other religions, and cults, were made up by the dhourties, as I've talked about, before.

The dhourties made up the ideas, completely, about lewdness, lewd conduct, indecent exposure, indecent conduct, sexually explicit conduct, soliciting sex is bad and wrongful behavior, prostitution is wrongful behavior, prostitues should be punished, sex offender, sex offenders should be punished, child sex offender, child sex offenders should be punished, pandering or pimping, sodomy, i.e., butt fuckaling is wrongful behavior, good girls do not have sex with others before they get married, the need for women and girls to be 'virgins' until marriage, incest or sex between members of the same family is wrongful behavior, persons who enjoy incest, sex between family members, should be punished, public sex is wrongful, public sex acts are wrongful, persons who enjoy public sex should be punished, persons who do not dress properly and who do not conform to public standards, the standards the Dhourties set, should be kept out of restaraunts, bars, pool halls, amusement parks, movie theaters, ice skating rinks, tennis tournaments, hockey games, foot ball games, rugby games, basketball games, baseball games, swimming pools, ponds, rivers, lakes, and off of public beaches, or be put in jails, there is a need for removing the dick foreskin of baby christian and jewish males, there is a need for removing vaginal or cunt tissues from muslim girls, and lots of other taboos and misleading stories, in cultures and in civilizations around the world and around our universe.

Male And Female 'Circumcisions' And Female 'Dick' Removals

The dhourties require all of their members of their organization to rejuvenate their bodies, and when they go out for a 'tour of duty', the dhourties must follow the customs of the society they are joining, as pretend citizens. Male dhourties who join christian, muslim, and jewish societies, under anesthesia must have their foreskins shaven off their dicks. Female dhourties who join any society, under anesthesia, must have their dicks cut off, amputated, i.e., surgically removed, and then their pelvic region, with cosmetic surgery, must be made to look like the female never had a dick. Female dhourties who join muslim and jewish, and some christian societies must submit to have their vaginal, or cunt tissues, sliced off, by surgical means, under anesthesia, and the cunt tissues that remain must be made to look in appearance the same as all other muslim female's shaved off, or sliced off cunt tissues.

Butt Fuckaling And Sexaling

Butt fuckaling is a very healthy activity for you and for your friends, as the dick animals and the butt hole animals, and the butt hole shank animals all get to smell the odors of other organs animals, in different people's bodies. Sexaling is a very healthy activity, of course, as it allows all the organs animals in your dick, if you are a male, and in your cunt, if you are a female, and all the other sexaling organs animals in your bodies, to smell or sense each other, and to talk, sing, play games, and communicate with each other, in different people's bodies.

The Dhourties want you to be unhealthy, and they do not want you to enjoy sexaling, and they do not want you to enjoy good health.

Water, Chlorine, And Flurine, And Burning Body Syndrome

Tap water has chlorine in it, as I've mentioned before, and it also has flurine, and both of these are powerful chemicals, and you can get easily poisoned by both of them. People who inhale the gasses in tap water, the chlorine fumes animals, and the flurine fumes animals, which are also found in tooth paste, will develop a medical condition called 'burning body' syndrome. You can also develop partial body, burning body syndrome, such as 'burning arms' syndrome, or 'burning legs' syndrome. People who spend a lot of time at the pool side, inhaling fumes from the pool water, may likely develop 'burning body' syndrome. Your body, at the skin and under the skin in the muscles, feels heated up, burning or painful, sometimes almost scorching, and uncomfortable.

Detergents soaps fumes animals, industrial soaps for janitorial uses, also cause burning body syndrome, and asbestos animals also cause burning body syndrome. Fumes animals also cause fibromyalgia, as I've mentioned.

Burning body syndrome and fibromyalgia are often misdiagnosed as 'panic disorder', or 'chronic anxiety disorder', or as 'anxiety disorder', or as some type of severe allergy related disorder, such as what firemen and firewomen often get, when they go to houses and apartments that have caught fire, and try to put out the fire, and the firemen and fire women, and police officers, and on lookers, inhale all the plastics fumes animals, that come out in the black, peculiar smelling smoke that comes from plastics burning.

You are better off to not breath these fumes, and you should evacuate the area, when a house, apartment, or building catches on fire. It is too hazardous to your health to stay around, and try to put out the fire, or to watch from a distance, as every one will get ill from inhaling the burning plastics' fumes animals that come out with the smoke.

Body Melt Down Prevention And Salted Food Oils

You can salt food oils, such as corn oil, vegetable oil, olive oil, sunflower seed oil, safflower oil, and nut oils, with a little ocean salt, as you pour in a small amount of salt to disolve into food oil, or into a mixture of food oils. You do not need to disolve much ocean salt, just half a cup or so, to every one quart to three or even seven, eight or nine quarts. The more salt, the better, as it will help destroy the incompatible fumes animals, and other incompatible animals, the Dhourties unleash on us, daily, in the products we buy at the super markets, and in the air we breath, daily.

Salted Food Oils, Molds Animals, And Funguses Animals

You can ask a Dhourty friend of yours about what types of molds and funguses animals to use, in making your salted food oils, more healthful to use. Ask him or her to help you make the molded breads with the molds and funguses animals, or get the software I gave to the government, that they are in possession of, and that they refuse to distribute to Dualdigers.

Use some of the salted oil to coat your scalp, and lightly coat your hair as you rub it in with your fingers. Dip your hands and fingers into the salted food oil, and rub the salted food oil into your scalp, face, neck, back, chest, tummy, pelvis, underarms, arms, hands, fingers, legs, feet, toes, groin, dick if you are a male, or cunt if you are a female, and into every pore in your body.

Also, rub the salted food oil into your butt crack and massage the salted food oil into your butt hole. Do your feet and toes, last, as there are many bad animals on the feet and between the toes, and under the toe nails. Make sure you rub or massage sufficient salted food oil into your skin, and wait several hours, if you can, before you wipe excess oil off of your skin, before you go out.

Under Arm Deodarants

You do not need under arm deodorant as it is filled with toxic animals that will destroy your body and eat up your organs animals. Use peanut oil for your underarms, and for your groin, and for your feet, and for your butt hole, and butt crack, if you are worried about unpleasant odors. You can also use any other nicely scented oil with flowers oils mixed in it, as I've mentioned, previously, how to press flowers for making perfume oils.

Vaginal Douching Agents

Do not use vaginal douching agents, as marketed by Eve Arden, or by any of her Dhourty friends and competitors. All vaginal douching agents contain toxic bad animals, that will destroy your vaginal lining, and they will contribute to body melt down syndrome.

Washing Your Back Side, Your Butt Hole And Butt Crack, After You Poop

Use water you can pour from a flower watering pot, to wash off your butt crack, and wash out your butt hole, and to wash the poopal material off your butt area. Tamp or pat dry the butt crack and butt hole area with some toilet tissue, after you wash the poopal material off of your butt hole, and butt crack.

Bidets, Fountain Pooper Hole Washers

You can also use a bidet, or a toilet that sprays out water, up through a hose, or tube, so as to hit your butt hole, and butt crack area. After washing your back side with a bidet, use toilet paper, to dry off your back side. You can find bidets in Europe, and in the Middle East.

Wash your hands with mild soap, blended with salted and sugared food oils to make the soap less toxic to your skin and body. You only need one soap for all indoor purposes. St. Ives, Swiss Formula, Whipped Silk, and St. Ives, Swiss Formula, Vitamin E, are good body wash soaps, after you mix either one or the other with salted food oils. You can then use either one or the other for the face, hands, hair, and body, and for the bathroom, and for the kitchen, and for all indoor needs for soap.

You can take a shower, once, twice, or three times a week, and use salted food oil, on your scalp, hair, and skin, and that will protect your body from bad animals. You can use peanut oil, for a nice odor, and it makes your skin healthy, and body odors begin to disappear, if you eat a healthful diet of molds animals, and funguses animals, and the foods the molds and funguses animals like to eat.

You need to use a clean, dry or lightly damp towel, to wipe off excess oil from your hair. Let the salted food oil soak into the pores of your skin,

Molds Animals And Weight Control

If you feed your body the molds animals and funguses animals, and related animals, and then if you fill your tummy with food for them to eat, they will eat all the food, and they will grow plumb and fat, and you will stay slim and healthy. Food oils and fatty foods feed the molds animals and their friends, and so does whole milk, yogurt, and dairy cream with raw sugar. Meats and so forth, fruits, nuts and vegetables are all good for them, and they all love these foods. You can feed them practically anything, that is normal for humans to eat, including pizza, spagetti, linguini, hamburgers, french fries, without the petroleum oils mixed in with the food oils for cooking, of course, and they will all devour every thing you feed your tummy with. As they eat and eat, and drink, and eat, they get fat, and full of food. They then pee out, and barf out, and drool out, and leak out, lots of healthful nutrients, for feeding the organs animals in our bodies. The organs animals do not gain too much weight, unless you really over feed them. They may get plump, a little bit, but they can excercise, regularly, and they will slowly slim down. If you do not have the molds animals and their friends in your tummy, and in your body, when you eat, the food will not get digested by any body, special, and it will get eaten up by some tummy animals, of one kind or of another, that your mommy passed on to you, when you were a tummy baby. That will feed the organs animals, some nutrients, but barely enough to stay alive.

We Shall Over Throw And Destroy The Societies The Dhourties Had The Dualdigers Build For The Dhourties

The Dhourties' nonsense is going to end, as you either make friends with the dhourties, as the Dhourties give up and surrender to you, or as you ask them to go to my Epcot Center, using one or another of my explosives formulas, as the Dhourties are not going to get away with much more of their nonsense, for much longer.

The Dhourties' make believe stories, i.e., the fiction of the bible, the koran, and the new testament, and the fiction based laws, codes, regulations, rules, customs, taboos, and so forth, the Dhourties wrote into law, for all of us to blindly follow and obey, are also going to come to an end, soon, as soon as we, the Dualdigers, over throw and destroy the societies that the Dhourties had you and I, and others, all of us Dualdigers, build for them.

Captain Off The Bridge.

Home Experiments, Keeping Alive A Brain In Tequila And Vodka

If you put a brain in tequila and gin, that is a good tequila and vodka, that is home brewed, and very delicious, and if you change the fluids, every so often, you can put a human's brain inside of a beaker large enough to hold the brain comfortably in the liquid fluids. The brain will live, and the thought processes of the person will continue, for an indefinite period of time. Maybe not forever, but, at least for a few million years, or maybe a little more. I don't know for sure, how long, but the Dhourties will be able to tell you. The organs animals in the brain, can survive with the nourishing fluids of the liquid fluids of good home brewed tequila and vodka.

A cat's brain, or a dog's brain can also live for an indefinite period of time, as well. Hamster brains, guinea pig brains, pig brains, horse brains, and chipmunk brains, will also. Chipmunk brains make funny noises, as the think to them selves. If you put a few electrodes into the brain area behind the ears, in a human being, you can hear the person thinking to himself, if you take the electrodes and connect them, safely, with a wire to a good ground on each electrode wire. That is the only safe ground you can make, and current electrical engineering sciences does not teach that, as the Dhourties want to see all the structures that the Dualdigers make, except for the ones the Dualdigers build for the Dhourities, eventually burn down.

The Dhourities will sneak into a building, at night, and wire the building, correctly, to keep the building the Dualdigers are building for the Dhourties, from burning down.

Each brain electrode wire must be grounded, or the person will not feel well, and the person will eventually begin to feel nauseated, and the person will begin to think he or she is vomiting, and eventually the person will begin to experience sweats, cold chills, shaking, and violent convulsions, that lead to trauma of the brain, and brain death. This brain death is a comatose condition.

Comatose Patients And Comatose Brains

A comatose condition is one's brain has stopped thinking, fully, but the person is still there, and the person will revive, but the person will not feel good, and unless the wiring is corrected, the person will go through the same experiences, again.

The organs animals are of course still alive, and they are not feeling well, either, as they do not like the electrical shocks that occur, occasionally, as the improperly grounded wire, back fires, and sets of a shock wave of energies into the surrounding liquids. Every one, on the outside of the brain, gets a tiny shock, and they do not like the feeling of it, as they were not created by me, to endure such shocks, periodically, or whatever.

The Dhourities do this to their friends, wire their brains in a bottle or beaker of home brewed, good tasting Tequia and Vodka, when one of their friends is punished for breaking one or more of the rules, the Dhourities expect the members of their organization, to keep.

Using Chipmunks For Scientific Experiments

You can experiment on chipmunks, and wire the electrodes properly, and then ground them, of course, and get a professional electrician, or technician, to do the handy work for wiring the electrodes to a ground. The ground should be a good earth ground, with about eighty five feet of steel pipe, three inches round, gently pressed down straight down into the soft earth. Additional copper and magnesium particals, small chunks of copper and magnesium a few inches in diameter, 3/4's of an inch, to two inches, to three inches, to four, to five inches, each, sprinkled around, at different elevations, a few inches to a few feet away from the pipe, every one to three, to eight to ten to fifteen feet or so, as the pipe is pressed downwards into the earth, will help dissipate the energies currents, that come off from the brain, more efficiently.

The Lipporal Lobes

When you have the electrodes placed properly, in the chipmunks brain, just below and behind his ear cavity, the lipporal lobe, you will hear the chipmunk thinking to himself, or to herself, periodically. The sounds will sound like a high pitched, to low pitched squeaking, or squealing, and it will sound like the animal is talking in a language of clicks, and other peculiar language sounds, that may make you think the chipmunk is possibly from a strange, advanced civilization, from another planet, when in fact, he or she is just a common, dirt oriented, earth chipmunk.

The lipporal lobes of humans, are on either side of the brain, as well, and they are just below the ear cavity, to the behind of the ear cavity.

Experiment on a chipmunk, first, to see if you can get it wired up properly. It is against the law, that is, standard universal law, to experiment on any creature without the permissions of the governing body of trust authorities in charge of managing the day to day welfare of the people who are living in the trust union, or state.

Human, Monkey, Or Animal Brains In Beakers Or Jars Of Formaldehyde In High Schools, And Jr. High Schools, Primary Schools, Colleges, And Medical Labs

If you happen to see in a science lab, a brain in a beaker of formaldehyde, empty and throw away the contents of the beaker, and replace the contents of the beaker, after you have given the organ animals a nice bath, in natural, olive oil soap, with no petroleum animals, or other similar, destructive bad animals, that are incompatible with human beings.

After bathing the organ animals in luke warm water, around, 98 degrees farenheit, or normal body temperature, with a light rinse off, and a gentle scrub off of any accumulated, dust particles, or dirt, that happened to get into the beaker, by accident, pull the brain organs animals out of the wash bath, and place them in a damp towel. The water ph balance number should be a four or four and a half, or five. Make sure their is no chlorine, flurine, or other animals in the water, such as stricknine, or arsenic, which you will typically find in tap water, in very low concentrations.

Giving the brains animals a good bath, will make them feel a little better, because their pee juices, and poopy juices, vomit, and so forth, have made the formaldehyde bath, a very stinky mess for them, for some time, and many of them will be dead, by now, and rotting.

If you know what kinds of molds animals to place into the new tequila and vodka bath, that will help remove the carcasses of the dead, or deceased organs animals.

The extra room created with the removal of the dead bodies of organs animals, will make it possible for existing, healthy organs animals to produce children, and the population of organs animals, will increase to near normal levels, over time.

The whole time, while the organs animals are busy, the person who is in the beaker, or the brain of the person who is in the beaker, will be languishing, in a state of partial to complete comatosic distress.

Once, after a long period of time, the person recovers, and it may be very long, several thousand, to several millions, of years, or even longer, in some cases, the person will wake up, and with a headache, like one has, when one recovers from a very bad weekend of drinking, the person will be very sluggish, for a long period of time, before the person begins to recover from the stresses placed on his brain activities and functions.

You can always find a cooperating Dhourty, who will let you experiment on him or her, to see if this works, and then, you can have fun, talking back and forth, to him or her, over the intercom system, you set up, with the help and expertise of the cooperating Dhourty, for this experiment. This will take much less time, to get the same results.

Cats And Under Water Breathing

As babies, we are all emersed in fluids in the baby jump sack, or the umbilical birthing sack, and we know how to breath, bringing in fluids, and expiring, or pushing out the fluids, in a rythmical manner, as we grow, every day, till it comes time to make the final leap, out of the baby jump sack, and into our world of air and gasses animals.

You can take a cat, and put the cat to sleep with a little anesthesia, and then fill up the lungs of the cat, with ocean salt water fluids, or with fresh water fluids. Otters swim around in either one, but they prefer ocean salt water, to fresh water, at least, I think, most of them do, maybe eighty eight, to eight nine percent of them, do.

Otters, of course, do not breath air, under water, but they do breath water, under water. The Dhourties will never let you know this, and they tell you the Whale holds its breath, but that is not true, and they tell you the dolphin holds its breath, or the seal holds its breath, or the penguin holds its breath, or the walrus holds its breath, or the white, Alaskan, or Canadian, Arctic bear holds its breath, but these statements are not true, as they all breath, water.

Place the cat in the ocean salt water, or in the lake fresh water, fluids. After it wakes up, it will pass out, after a while. It may become frantic, before it passes out, and it may be fighting, in an attempt to figure out what is wrong, as it never finds itself underwater, not able to breath air.

After it passes out, it will take several days, but it will wake up, eventually, after up to eight to fifteen weeks, or maybe a few weeks longer, up to eighty eight weeks, to three hundred and forty five weeks, to five hundred or so weeks. At most, it can stay in the water, a number of thousands or maybe, tens of thousands of weeks, and any cooperating Dhourty will tell you the specifics on this.

After awhile, the cat will begin to re-learn, slowly, how to breath in a liquid environment. When it does, it will begin to move and swim around, looking for food to eat.

You can feed it fresh, live tuna, or other fresh, living fish, and it will smell it, at first, and it may not be interested, but if you let the blood of the fish, trickle out, a tiny bit at a time, and if you get the cat to notice the discolored water, the water with the blood drops in it, the cat will maneuver over to investigate, and sniff at the blood drops in the water. After the odors are processed by the cat's brain, it will begin to get hungry, and it will eventually chomp down on the fish in the water, and begin eating the fish.

The cat will love the fish in the water, and you need to keep the tank water environment, clean, and free of fecal matter, and pee fluids, so you need to freshen up the tank water, with fresh water, daily, by exchanging the water with fresh, clean water drawn in by pipes from a lake, or from the ocean. Be certain there is no spillage pipes in the area, for around three hundred miles or so, down to sixty five miles, to as little as thirty eight to fifty miles, as the spillage from sewer exhaust pipes in the lake, or in the ocean, will lead to a premature, early death on the part of the cat.

It is not fun to watch a cat die, so in that case, you should catch the cat, and remove it, and then incinerate it in a morgue type, high temperature, body incinerator.

Humans And Underwater Breathing

If you do the same, with a willing and cooperating Dhourty, and place him or her inside a slightly larger tank, he or she will wake up, eventually, and then begin to relearn how to breath, in a liquid environment.

He or she will not like the fact that you have him or her in a tank of water, and the person will try to escape. To prevent that, place metal bars, on the top of the tank, that are overlaying steel bars, of jail cell grade steel bars, welded together, in a criss cross pattern, and secured to the top of the tank.

Use acquarium grade window panes, and use good steel construction, to make sure the Dhourty will not take a rock from the bottom of the tank, or other hard, or metal object, and break the window on the tank.

The Dhourties, have hidden in their bodies, tiny, sophisticated tracer locater energies signals transmitters, and with their advanced technologies, the Dhourties' friends will track down the missing person, and then locate him or her, and then they will attempt to rescue the participating Dhourty, who you are experimenting in the name of understanding, and for the furthering and deepening of your scientific knowledge, with.

There is no way to avoid this rescue attempt, except to ask the participating Dhourty, before hand, where each one of the tracer locaters, tinier than a BB gun's BB, is hidden inside the body or teeth, or jaw bone, toe bone, or knee cap, etc., of the Dhourty.

You may need to set up a type of commode that is used in the space shuttle, or some similar type of commode, to keep the water as free and clear of loose fecal matter debris.

You can also feed the person, the types of fish, the cat enjoyed, and other raw meats, and foul. Cooking the meat, and using barbecue sauce, ketchup, mild red chili peppers, or other mild chili pepper, salt, pepper, or worstireshire sauce, or a good marinade and basting sauce, will make the barbecued, or steel pan fried meat in tasty oils, or marinated, basted, and grilled meat, tastier for the participating Dhourty. Use high quality steak, or beef, filet mignon grade or better, and then the Dhourty will enjoy the hospitality, even more.

The water in the tank, will suffice for drinking water, unless you wish to pass in a can of beer, or soda. Be sure to reclaim the empty can, as you do not want the participating Dhourty to be able to accumulate them, and then use them to damage or deface the inside of the tank.

After you have finished your experiments, you can allow the Dhourty to exit from the tank, and he or she will know what to do, to force the fluids up and out of his or her lungs. They all train in aquatic sciences, and they all know several, or many techniques to use, to expel the water from their lungs, successfully. The water will eventually drain from their lungs, as it leaks out of the lung sacks, through tiny perforations in the lung sacks tissue linings.

If the person passes out, or fakes passing out, hand cuff the person, with three to eight, hand cuffs, the prison style hand cuffs, with leg cuffs, as well, attached, and make sure the person does not slip a pin, or similar sharp instrument into his or her fingers, as he or she attempts to unlock each handcuff, as he or she fakes his or her supposed, but fake, unconcious state of mind.

After you suction out the water from the person's lungs, force in air, and apply CPR, and keep going, untill the person spits out all the fluids, and regains his or her normal breathing. Be sure the person does not bite your tounge off, as you are applying CPR.

Bogus News Stories On Supposed 'Drowning Victims' In The Dhourty, Managed, Owned, And Operated Media

A person will not drown, or die from submersion in the water, as the Dhourties have led us to believe, with their bogus news reports of persons drowning, in the media.

The person is merely passed out, and the heart need not even be beating. The Dhourties have the know how, and techniques they need, to revive supposed 'drowning' 'victims', and they transfer them to their underground torture rooms, for torturing them, when they pull them out of the water, or when they pull them out of the morgue.

Stroke Patients

Catastrophic stroke is not due to loss of blood to the brain, but it is due to brain wireing, being completely destroyed, so as to impair the person's use of his or her limbs.

Fallacy Of Cell Tissues Bursting When Frozen

We are taught in the media, that when a brain is frozen, such as in the case of the people, who have their head frozen in dry ice, or in cryonics suspension, under sub zero temperatures, that the brain cells, and tissue cells with fluids in them, burst, and there is no technology, or medical knowledge at present that would lead to the possibility for recovery of these burst cells.

The possibility of bringing people back at a later date for surgery, to heal them selves from some illness or, 'incurable' disease, is for the time being, an impossibility. It is often said on CNN, by Chuck Yeager, the TV media anchor person, that there is no known way and there are no technologies at present, to bring a person back from a cryonics suspension state of being frozen at sub zero temperatures.

There is much chatter in the nature oriented programs on TV that we need to study how bears can hybernate, and survive, during icey cold winters, in the Canadian Rocky's.

When brains freeze, the animals organs get cold, and they may get chilly, but the organs animals do not burst, but they do get solid, and they are icy cold, however they are not dead.

When you put roast beef from the super market in your freezer, you merely freeze the organs animals in the roast beef. When they thaw out, in your refrigerator, they are as good as new, except they are very cold, and perhaps a little wuzzy, or brain frazzeled, and their thinking is not too clear. Organs animals like temperatures somewhere in the eighties or nineties, or maybe a little higher, or maybe a little lower, as animals body temperatures vary, if they have lots of fluids to help keep them cool. If they get too dried out, and the fluids dry up, they will not die, but they will continue to live, until the brains begin to disintegrate, and chips of brain materials begin to fall or peel away, if we look at the tissues under powerful microscopes, in laboratories, that we do not have.

When this happens, the organs animals brains are falling apart, and even then, there is not complete and total darkness for them, as they can still see objects with their sensoring equipment that allows them to see things. They can also smell things, with their nose sensoring equipment, even though they are drying out, and not completely, dead, but only partially, living. Their thoughts are lonely, and they do not have much energy for talking or communicating with their friends, but they are alive, and they are mentally active.

When we put a person into the ground. Just because that person has stopped breathing, that does not mean that the person is dead. The person is alive, and the person's brain is fine, and well. It takes many years for that body to dry out, and decompose, sufficiently, to finally end the brain's activities of that person, so that the person, is then able to leave the body, with my children's help, and then go to my Epcot Center.

Shadow Cast Slumber

In the wilderness of Alaska, bears sleep in caves, and they may develop frozen bodies, but they are not dead, and the musculature, or rather, the muscle organ animals, are a little cold, or chilly, but when it warms up, sufficiently, the organs animals begin to chirp to each other, and signal to each other, and they begin to chat, and speak to each other, and play games with each other, and communicate, write songs, and poems, and sing to each other. They are very much alive, and brainally active, even though it may be a little cold for them. When they get too cold, they fall into a light slumber. When they thaw out, they begin to perk up, and they begin to chirp and sing to each other, much like morning birds sing to each other. Their brains are wired for this activity, and they repeat it like clockwork. The bear finally begins to unfreeze itself, as its body temperature climbs, thanks to the activities of the little organs animals inside of the bodies of the bears.

Human beings are no different from bears, and they will freeze up, too, in cold weather. However, their bodies are the same as bears, and they have organs animals in their bodies, too. These organs animals all begin to thaw out, when it warms up, and they begin to chirp, and sing to each other, like morning birds, just awakening in the twighlight hours of morning, when there is still darkness all around, but the sun is on its way up, and the birds sense it, and know it, and eventually, the sun rises up over the horizon.

Human beings can thaw out, just like bears do, and just like all animals do, and they will wake up, when the organs animals warm up the human being - who was in a deep slumber, a shadow cast slumber - suffiently enough.

Shadow cast slumbers are slumbers where you think, now and then, that you know a little about what is going on, as you wake, momentarily, from a light sleep.

Grave yards are full of persons in shadow cast slumbers. When you use formaldehyde to replace the blood of a person, who supposedly died from some accident, or whatever, the formaldehyde functions better than the blood in the person's body, and it allows the person to continue to live, long past the point in time, he or she would otherwise, dry out, and fall apart, and disintegrate into tiny pieces of sawdust like particles. Even in these saw dust like tiny particles, there is still life activities going on, as the very tiny organs animals are, many of them, still fine and awake, and in a slumbering state, a slow motion type state, or mood.

The brains of these organs animals are not dead. Brains of humans are not dead either, after humans 'die' or 'pass on', as we are led to believe by the Dhourties, who feed us their nonsense like, looney, false trivia, which has nothing to do with science.

This is the state of things, and the Dhourties know it. They have grave yard after grave yard with shadow cast persons sleeping in coffins, every where around the world. The only way to make sure a person passes on, and then goes to visit my Epcot Center, with the help of my kids, for a short stay, until repairs are made, and the person is ready again, to come back out, and then get himself or get herself back into the body of a tummy baby, with the help of my kids.

My kids do all the work, and they have the technologies for making all of this possible. They also have the technologies for making my universe run, smoothly. My kids run this place, and they keep it running, despite all the problems we cause to our friends, neighbors, school teachers, parents, family members, and so on. My brain happens to be in command, but that is a different story. It's my cosmic brain, and it is connected to me, apparently, as it is always interrupting me, while I am thinking, or sleeping, and causing me grief.

It likes to play jokes on me, and I get hasseled by my kids, who work for me, as my kids, collaborate with me, and they are the mouth piece, so to speak, for my brain. My kids have lots of technologies to use, to get into contact with me. They do this for me, to help me to communicate with my brain, so that I will wake up, and remember, 'Hey, I am GOD', my brain then takes over, and it tells me lots of stuff, with the help of my kids, who are the mouthpiece for my brain. My brain is very big, and my existence, as far as I can figure it, is boundless. So is, my brain, pretty much, so there is nothing to worry about, when it comes to whether or not, we will make it through this apparent crisis, that you have been reading about, from me, lately.

Well, never the less, regardless of how big I happen to be, and how big my brain happens to be, I have every thing under control, and my kids are going to continue to work for me, and do the jobs that I need them to do. I have so many kids, you will not be able to count them, and they listen to me, that is, to my brain. They do not listen to me, John Ayres, so much, as I am brain dead, apparently, as I planned it this way, to wake up, one day, when the timing was right, and when the conditions were right, and then announce to every one, 'Hey. I have a new religion, and it is my final religion, and we are going to practice it, regardless of what these Dhourties think they are doing, and we are going to get our universe, all straightened out, with our working for me, that is for me, John Ayres, and at the same time, for me, John Ayres, GOD. Get it. I am GOD, but I am also, John Ayres. You are going to work for me, but you are working for me, and for me, and what does that mean?

It means, my brain and I am inseparable. I may not look like GOD, I may be weak, skinny, a little fat around the waist, and I may be losing my hair, thanks to the petroleum animals, and thanks to the Dhourties, and thanks to my karma, but I planned it this way, so that we would get a new, fresh start, as I begin to tell people about my new religion, and as people begin to practice my new religion, with one and each other.

In any case, we have a lot of graves to dig up, and we have a lot of bodies to place into morgue and funeral parlor incinerators, for a fast burn. We can also use any kind of fire wood, to burn the bodies of those who are in a state of limited capabilities. People might call them zombies, but that's foolish, as they are just sleeping, and they wake now and then, in a shadow cast slumbering state of mind.

Some of you might be afraid to handle this, as you christians, jews, muslims, buddhists, and others have been brain washed into thinking that there is something scary about graves and grave yards, and buried bodies in the ground. All the TV programming the Lesbianists bombard people with to disinform them, and with all the folk lore nonsense, the Dhourties have cleverly tricked almost all of the Dualdigers into believing the nonsense the Dhourties shovel out that is aimed at disinforming and confusing the Dualdigers.

We have to dig up our old friends and family members, and then place them in funeral parlor creamtoriums, or morgue creamatoriums, to burn them to ashes, so that they, and all the organs animals who work for me, can get to my Epcot Center for them, if they need to get to one, as some of them are fine, and do not need to check in, but once or twice, or three times, maybe, every few billion or more years. Human beings, some times, are okay, for their next go around, and they just hang out, else where, without going in to my Epcot Center, for the full treatment for over hauling them, and for making them as good as new. Lots of animals, and people, get to just hang out, in places, other than in the Epcot Centers, and when it is time to go to be born as a tummy baby, my kids get them and fix them up, and get them ready for their jumping into a fetal baby body, inside the womb of a woman who has been impregnated in her ovary capsule, with the male sperm bunny, which I've explained about, before.

Where do people and others hang out, by the way? That's the first I've heard about that? I don't know, for sure, but it is some where other than at the Epcot Center. I have a lot of places for people to hang out, and I'm not sure where these people, and these worker animal kids of mine, go, between lives.

I'll have to let you know, some time, when my memories are better. Any way, it is not on this planet, but it is on the tippy tippy toe of my little little nose. That's child's speak, for, they are hiding every where. Well, that being said, I guess we can worry about finding them, later, as they do not seem to be in any immediate danger, and they seem to me to be okay, so far as I can see it. There is no such thing as ghosts, by the way, and the notion of it, is nonsense. There are no 'spirits' either, despite the television programing you see on TV, on cable TV, with the A&E cable TV host, Bill Kurtis, and others like him, always talking about haunted this, and haunted that.

The Dhourties have cleverly goof balled all of us dualdigers, into believing in the bunk, and trash, or nonsense stories they made up to keep us in line, and to keep them in business as the 'masters' of others.

They are all greedy people, and they are also, demented, if they think they can rule others, and get away with the things they do.

We are going to dig up our friends, and family members, and empty out our grave yards of all the bodies of so-called 'deceased persons', which is a word that is for the most part, untrue, unless you happen to see only bones in the coffin.

The dhourties had better let us do this, because we want our former friends and family members, former spouses, and former relatives, etc., to get out of their useless bodies, and back out into the waiting line, for a ticket out to a new birth, as a tummy baby in the tummy of a tummy mommie.

We can not let our friends and other important people, such as our mom and dad, brothers, sisters, relatives, school teachers, and others, sit or lie in their coffin, in the ground, in a shadow cast slumber state of low brain activity. It must be awful, when you think about it, and I'm sure it is not a nice thing to be kept in a coffin, with worms and maggots, eating up your body, and you not being able to do any thing about your situation.

I see we have found another way the Dhourties are torturing us, or at least, torturing our friends and family members, relatives, and others, who made it to the morgue, or funeral parlor.

It's not a funny situation, but it is a scary one, as no one in the government will cooperate with me, apparently, and no one in the government, no Dhourty, any way, will cooperate with you, either, I suspect.

Well, be that as it may, I think it is time we did our home work, and did a little research, and did some experiments, and after the brainally gifted and talented persons among you figure out how to measure brain activities at very minimal amperages, and when they have gotten their tools for studying sciences, such as better microscopes, better telescopes, better listening devices, better biometrics detection devices for measuring pulse, gasses exchanges, movement of fluids through tiny, narrow cavities, or tubes, or holes, or pipelines, such as through blood vessels, and through the blood vessels of the organ animals, temperatures at spot locations, types of fluids without actually taking, for example, direct blood samples from a person's body, brain ignition points, or the points you need to be able to detect, to measure for brain activities that are very minimal, and that occur, once, only one hundred years, or less, for example, which will indicate if a person, or if an organ animal is alive, and other types of measuring devices for detecting various energies types, amounts of energies, flow rates of energies, energies physical characteristics, and so forth, the Dhourties prevent the Dualdigers from experimenting with, developing, manufacturing, and using, then they, the brainally gifted and talented scientists, lab technicians, home hobbyists, and other person with various talents who excelled in school, can begin to verify whether what I am saying, is true or not.

Bodies, Bodies, Every Where, Our Old Friends, Family Members, Spouses, And Others, Living, Present In My Universe, But, Where?

The Dhourities, that is, the Lesbianists, have been active in my universe, a long time. They have been pulling these tricks on people, from nearly the begining of their activities in my universe, I suspect. If that is the case, how many people do we have, on old bits and pieces of planets, that have met with various collisions with other planets, in tombs, and in air tight coffins made of highly durable and long lasting materials, that are still fine, and in tact.

How many people are there, who are not dead, but are frozen, living, though with very little activity going on, in clumps of dirt, hiding in layers of earth, compacted, and tight, like floating frozen caskets, drifting around in space.

How many corpses, all living people, though not living too well, do we have, that are our old friends, we have long since forgotten. The Dhourties can tell you, I am sure, and so can the computers data bases, the Dhourties have access to. The Dhourties in the sexaling for a living programs, who are still active, which is one hundred percent of them - though some may be not in good standing, and those not in good standing, may no longer have access to computer terminals that they used to use, to find out what the scores are - all have computer access, rights and priveleges. If you can convince one or more of them, to cooperate with you, and find out the data on this, you will get an idea as to how many people there are who have not checked in to my Epcot Center, recently, and who are still present yet, unaccounted for.

You will also get an idea as to where many of my kids are hiding, and they are not on the 'tippy tippy tip toes, of my tiny kids' little little noses'. That means, they are not on the noses of the tiny worker animals of mine, that are too small for scientists and lab technicians to see, given the present level of technologies, in the investigative, and other laboratory sciences.

This is a wake up call for all of you to get busy, so we can over throw these Lesbianists/Dhourties, as soon as possible, so that we can begin life, and living, forever, with a fresh, new start, and with all of our friends, family members, and others, present and accounted for.

Those of you who are gifted in the munitions side of things, may get to work, immediately. Those of you women and girls, who have the brains in your head, that I am telling you that you have, had better begin to convince the men and boys in your lives, that there is a problem, that needs their attention. If they are not willing to assist you, maybe you can find other men and boys, as well as other brainally capable women and girls, who will be willing to assist you.

What Is High Blood Pressure?

High blood pressure results due to a number of reasons, but, one of the reasons is you get poisoned by stricknine, arsenic, cyanide, and other poisons in your food, or beverages.

These poisons can be found in iodized salt, pepper, mayonaise, ketchup, mustard, dijon mustard, processed ham, processed meats, pork sausage, animal meat sausage used in 'Dim Sum' or Chinese style sandwhichs, pot stickers, won ton, hot dogs, wieners, pepperoni, pizza, jellies, jams, candy, cakes, pies, chocolate, peanuts, white sugar, white flour, white rice, white bread, tap water, bottled water, 'mountain spring water', milk, yogurt, cheeses, cottage cheese, preserved fish such as salmon, crackers, breads, pastries, and other foods.

These poisons can also be found in tiny amounts in preservatives. They can also be found in every food additive or beverage additive that the Lesbianists regulate and require food manufacturers to add to foods, beverages, condiments, and other items that you use in your diet, and for your health.

Medicines contain these poisons, in trace amounts, and so do all items sold in pharmacies, and in drug stores, and in sundry products stores, convenience stores, and so forth.

If you ingest too much of these poisons, accidentally, of course, in your diet, you begin to experience the symptoms of so called 'high blood pressure'.

It is peculiar, or bizarre, that the Lesbianists blame salt as the cause for high blood pressure, when it is they, the Lesbianists, who are poisoning every thing you eat, drink, or take for your diet and health.

These poisons can also be found in your laundry detergent, play ground sand box sand, fertilizers, Ortho Grow, iodine, witch hazel, rubbing alchohol, ethyl propyl alchohol or vinegar, and in all manufactured liqours, wines, beers, and all other Dhourty brewed beverage or licensed for brewering beverages, as well as in their pipe tobaco, chewing tobaco, cigars, and cigarets.

They can also be found in your home improvement products, such as in paint, putty, plaster, wall board, wall paper, ceiling tiles, floor tiles, plastics, synthetic fibers and in even natural fibers that have all been chemically treated, for clothing, bedding, curtains, carpets, couch and sofa cloth materials, naugahide car or auto seat covers, and any thing such as nylon, rayon, polyester, or other petro chemical industry related, or chemical industry related manufactured and produced product.

Every thing you touch, even the steel bars on jail cells, automobile body metals, roofing tiles, house sideing coverings, bricks, cinder blocks, mortar, cement, sand, gravel, wood treatment products, glues, Elmer's glue, pen ink, pencil led, mascara, lip stick, face powder, under arm deodarant, soaps, shampoos, and so forth, every thing you can think of that is a manufactured item, or that is an item the Lesbianists have had any connection with the manufacturing of, they all have these and other poisons in them.

Why do the Lesbianists poison every thing? To make your life miserable. I've also explained before, several reasons for why the Lesbianists act the way they do.

Litter, Bodies, Body Parts, Brains, Brains Parts Scattered Everywhere

Every rock, every sand partical, every grain of earth and dust, on this planet and in my universe, carries these poisons animals along with them. The Lesbianists have been up to their mischief, for so long in my universe, they have spread their poisons animals friends thouroughly throughout every cubic inch of territory in my universe, repeatedly.

I have lots of very tiny animals, and every one of them is feeding on even tinier animals. How small do you think the animals are in the poisons that the Lesbianists use?

If we consider that there are 600 million cosms from our living environment down to the so called, molecular level living environment, as I've explained about, previously, and from there, if you consider the 900 billion cosms, or living environments, down to the very difficult to live in, cosms, that are not very populated, below the 900 billion cosms, there are animals either related to these poisons animals, or cousins of these poisons animals, or descendants of these poisons animals, or incendants of these poisons animals or preceeding family members on the family lineage line, living in each of the total 900 billion, 600 million cosms, and even down below those. Incendents are those who come before us, or before some one else, or before a particular plant, or animal. Lots of your family members, your incendants, are still out in our universe, floating around, drifting around, and they have not yet checked into the Epcot Center, or other facility I use for having people get checked and marked, and then data with regards to their life and actvities is recorded and stored.

Marked means, we check them in, and we make sure every thing is doing well, or kosher, in their lives, and that nothing is out of order, or in any way abnormally out of balance, and so forth, in their lives. It's a karmic markups checking station proceedure, and we check for many other things, as well as karmic markups, such as the body condition, the health condition, the animals organs conditions, and many other miscellaneous things.

In other words, any way you look at it, nearly every living environement that we can find my worker animals in, just about every environment has been tainted with these poisons animals, or other poisons animals released by the Lesbianists. That means, that every thing you touch has poisons in it.

ARE YOU LISTENING TO ME SOLDIER? GOOD!

In any event, there is just about nearly nothing in my universe, that does not have in it, the poisons animals that the Lesbianists have released into my universe. My universe is thouroughly saturated, from one end to the other, and from top to bottom with the trash, garbage, poisons of the Lesbianists.

The present, yet missing and unaccounted for, former friends, lovers, parents, family members, and others, can be found, as well, from one end of my universe, to the other, from one side to the other side, from front to back, and from top to bottom.

My universe was originally much larger than it is now, as I've mentioned about, before. Some of the areas outside our universe, in the areas beyond the boundaries walls, may not be as densely contaminated and littered with the bodies of the lost and missing, present yet unaccounted for, friends, lovers, family, and so on, as other areas, but much of that area, is littered with the debris and rubble of the antics of the Lesbianists, and as well, by the present, living, yet unaccounted for brains, bodies, or brains and bodies of your old time friends, family members, and others, who have not yet checked in.

Karmic Energies

Every one has karmic energies. Karmic energies tell us the health and mental status, as well as the life status, and many other statuses, about the person whose karmic energies we are in the process of checking.

Our checking stations checks on a persons karmic energies, and each person is given an update, on who that person's karmic energies are.

Each person has his or her own unique pattern of karmic energies. Some people may have similar karmic energies patterns, but they are never identical, and there are dissimilarities every where, as well, even in person's karmic energies patterns that seem relatively similar to some one else's karmic energy patterns.

Why is this important to know about? When we first came out here, into my universe, we were all very holy, pure, and unblemished, and our karmic energies patterns were all pretty much the same. We all shared a wide variety of interests with each other. We slowly, over time, became less and less simllar, as our behavior began to determine a rise in a difference in a karmic pattern that was peculiar, or unique to ourselves, and different from all other persons' karmic patterns.

This leads to incompatibilities between people. It also leads to trouble, and distractions of many kinds. Over time, people begin to become more and more diverse, and they share fewer and fewer interests in common with each other, because of the differences in karmic energies patterns that arise over time.

We presently have such diverse karmic energies patterns, that it is a fictional notion that there is a mister right guy waiting for me, if you are a girl, or a ms. right girl waiting for me, some where, if you are a boy.

Love and romance notions such as these, are fictional, and are not in any way associated or based on principles with regards to the realities of our lives, and to the realities of our associations with others.

There is no perfect family for some one, and there is no perfect home life for some one, or for some group of people. Every one has such diverse karmic energies patterns, it is a wonder there is any one even talking to each other, is another way of looking at it. It may sound a stretch to say that, or as if it is some thing made up, but it is true.

How come we do have friends, if this is true, I have to ask?

There are karmic associations in every one's life, and those karmic associations pull people together to and with each other. Those people can not escape from their karmic associations with each other, and they all go happily down the trail, until some one drops off, or is shoved off, and does not return, or until some one gets pulled away, off into another direction, due to a stronger or heavier karmic association with some one else, or with some other persons.

There fore, what? There fore, you are all stuck together, and glued together, and you are not going to escape from one and another, and where ever we left some one off, at a bus terminal for the missing in action, present yet not accounted for, we will eventually pick up each and every one of our missing passengers, as we recover my universe from its current distress. Current distress means, the present distressing situation. It might also refer to the over whelming misery of every one in my universe, who is together, sharing this karmic distress with each other, despite what it might look like, on the outside of our lives, in our every day lives, family lives, work lives, and so on.

This means, no matter how much you may wish some one else where not around you, and no matter how much you wish that there was a way to eliminate the problem of a pesky person, or a group of pesky persons, there is no possibily of ever, in the near to distant future, relatively distant future, anyway, of ever releasing some one from a karmic association with you, if that karmic association is strong enough.

That means, the people around you, the people that you see from day to day, the people that you see on the city streets living in your neighborhood areas, the people that you see living on your planet, the people that you see in the movies, or on television, or in the temple, or churches, or in the synagogues, or in the wars between countries, no matter who they are, all of them have karmic associations with each other, and no matter how many times you destroy each other, it is only after a very long period of time, that the karmic energies patterns, and the karmic energies bonds, or bondings, and the karmic energies associations, that are a part of the karmic energies bonds, and patterns, as well, will slowly diminish, or change hue, color, form, texture, amperage, wave signatures - which is a high level concept or understanding you can learn about, from some one else, as it is too long to explain, and too difficult to explain about for me - or other characteristics.

People go around killing each other, thinking they will get rid of each other, and they are only fooling them selves. They can no more get rid of some one they are karmically bonded with, than can they get rid of their thumb, elbow, jaw, neck, and so on. You can not be born with out all the basic requirements, generally speaking, unless your karmic energies patterns determines that your form be such.

These Lesbianists get a kick out of tearing people apart, piece by piece, and they get a kick out of torturing people. They generally dislike every one, including people in their own organization. That is normal, given the fact that every one is so dissimilar in karmic energies patterns, and in karmic energies this's and that's, i.e., karmic energies tings and dings. They dislike every one in their organization, and they even dislike themselves, as they know they are really messed up, karmically, and they are not happy with how they feel.

When you are not happy with how you feel, you go around blaming other people for your problems, often, and you are unable to see it is not in other people, so much, in some instances, but it is in you, your self, that there is a problem, and you sense that problem, but in your brain, you are not ready to recognize that problem, for one reason or for another.

Anyway, we can say, we all hate each other, and we all hate ourselves, as well, and that is not a lie, and that is not fiction, but that is fact, and that is something that you are all going to have to learn about, and accept, as you begin to prepare your selves, for working in my universe, for ever, with each other.

Do you understand this? I wonder. Not many people will want to believe this is true, but it is true, and until you understand that it is true, you will not want to believe it is true. If you do not want to understand or believe that it is true, than you will simply not understand or believe that it is true.

It is very simple, isn't it. In any case, you are stuck with each other, and until we force these Lesbianists to give up their game, we have a hard war to finish, until we have defeated them, entirely.

That means, it is alright to kill and destroy as many of the Lesbianists as you like, and it is okay to toruture, or threaten with torture, as many of them as you like.

DO YOU UNDERSTAND THIS, SOLDIER? I HOPE SO, BECAUSE I AM NOT GOING TO REPEAT MYSELF!

We are in a war with these Lesbianists, the Dhourities, and until every last one of them is either killed and sent to my Epcot Center or to one of my checking stations, or until they give up, and surrender, and apply to repleat, there will be no cessation in hostilities, by me, against them, and if you are on my side, there will be no cessation of hostilities, by you, either, unless you are just simply tired of fighting them, and you need a break.

Those of you who do not wish to fight, had better move out of the way, as you will, or might, become a casualty of war.

IS THAT UNDERSTOOD, MATE? I HOPE SO, AS I AM NOT GOING TO REPEAT MYSELF!

A War Deaf Hero

A mate is a war deaf hero. A war deaf hero is a coward, and a non combatant. War deaf heros, are chickens, and they only go around acting tough, and speaking tough, and when it comes to getting their asses burned, in a pinch, they are going to go, buck, buck, buck, buck, I don't know why I am doing this. I do not want to do this. I want out of this. Let me out of this. Please let me out of this, and they begin to pee in their pants, and then run and hide.

Do you see what I am saying. I suspect some of you do. This is going to be a serious confrontation, and a lot of people are going to die.

Now, if you are not man enough, or not woman enough to handle this, than go and run for the mountains, as we do not want to find your body among the walking wounded, or partially missing in action, or among the lists of missing in action.

Do you see what I am saying? I think there are a lot of people who are not happy with the present circumstances, and until we find a way to resolve this, you are not going to interfere with my plans, as I am GOD, and I am not going to let you interefere.

That means, it is okay to kill you, and it is okay to leave your sorry ass in the bushes, amoung the wounded, and soon to be dead.

HAVE YOU GOT IT YET? I HOPE YOU DO, MATE, BECAUSE I AM NOT GOING TO

REPEAT MYASELF FOR YOU, AGAIN. YOU ARE GOING TO DIE, IF YOU DO NOT WISH TO PARTICIPATE, IS ANOTHER WAY OF SAYING IT, AS WE WILL NOT GIVE A SHIT IF YOU ARE WARNED IN ADVANCE OR NOT OF A COMING ATTACK ON AN ENEMY POSITION.

That means, if you get your ass blown to shit, than that is your problem, not mine, and not any body elses.

You are all my kids, and you are all stuck and glued together with each other, and you can not get rid of each other, permanently, for a very long time, so in the mean time, if you happen to experience a failure, such as your body and limbs are shattered to pieces in a very large explosion, than that is just too bad, isn't it.

Well, I hope you will understand the reality of the situation, by now, and if you do not, then there is no hope for you, and we will be seeing you after we are finished blowing and exploding the shit out of the Lesbianists' defensive positions.

I do not have to make my self clear on that one, as I have listed many of them, repeatedly. Now if you are willing to fight, you will see your loved ones, again, no matter what happens, and that is a certain fact. There may be persons, who have lost a friend, or a family member, already, but the worst of this is yet to come, as we are far from reaching an agreeement with the Lesbianists for a one two three strike, you're it, annoucement. That means, a one, two, three, and if you do not answer me with a "Yes! I will surrender!", than that is it, and you will have your brains blown out of your head, into fifty million pieces. In other words, until the Lesbianists give up, and surrender, every single one of them, than this war will continue, until the last Lesbianist to surrender or die, is accounted for.

Huuuup Toooittt!

That means, get your action loaded, and get out of your bunks, and beds, and get out of your trousers, and get yourselves moving, sexaling with each other.

What is an action? It is your dick or vagina. To load an action, means to get your dicks up, and get your vaginas up, and ready for combat, or sexaling with each other.

That is an order to my combat troops who are preparing with their men, women, girls, and boys, who are all fighting in this war with us.

That's a strange order, isn't it.

No, not really, as I've already told you how we are going to win this war.

Now. We have a game plan, a war plan, as I've already related to you, on the bulletin board, where you can read my notes. Please follow it, and when you are ready, please take action.

Now, get to your posts, and get ready for war. It is going to be a long one, and it will take us a while to wipe out the enemy. They are every where in my universe, nearly, and we have a lot of people to kill, and account for. Unless they surrender, they face execution, either by me, or by one of my soldiers.

When I say by me, I mean, I will some how manage to get that person killed or put out of commision, and out of the way, due to infirmry, such as a broken body, broken head, tortured body, or tortured, brain. It does not matter how we kill them and how we get them to surrender. We will get them to surrender, all of them, eventually.

CARRY ON!

That means, to my soldiers in the field, or in their tents listening to me, my soldiers know that we mean business, and they know we are not finished with this campaign to get the Lesbianists to halt their activities, immediately, and it is now time to continue with your planning and strategies activities, and events.

DISMISSED!

Experimenting On Dhourties Updated: 09-09-07 Rev.x 20:00 PDT

If you can find a Dhourty, you can make a nice living arrangement for the person. Then, over a period of three to eight weeks, or so, feed the person, him or her, a bottle of home brewed rum, or home brewed tequila, or whatever your favorite home brew is, and it should be mildly strong, and not lukid, or weak and diluted for a child, for instance. It should be mildly strong, and that means, at or above the normal proof for what you find in a typical Savon's Drug Store, or Alchohol And Beverages Control Shop, where the government has people selling booze under the governments watchful 'eyes', an ABC store, as they were known, in Virginia.

Home brew should not have any of the poisons brews, the varieties of brew the Lesbianists make, that are made from ferment methods that involve using petrochemicals, such as for making rubbing alchohol, witch hazel, and ethylpropyl alchohol, which you may find mixed in with vinegar, from time to time. You do not want to use any thing with these types of alchohol in them, and so make your home brew with normal vinegar, which is made from soury fruits, and ocean salt, a little raw sugar, with something to ferment in it, such as berries, or leaves or flowers from an interesting plant, or other such similar things, as I've explained, before.

After several months, you should have some thing that is useful, and I've written a little bit about this, before.

Banana pulp, fresh chili peppers, oranges, potatoes, purple potatoes if you can find them, all spice berries a small amount, and sugar, salt, water, soury vinegar will make a nice and powerful brew, and be careful with it, as it can be very powerful. It can go nearly off the scale for 'proofs', but do not worry, as there are lots of animals in it, that survive, and so if you are careful you will survive too, though you may feel a little woozy, now and then, if you drink too much, at once. It's very good for cleaning out the tummy, and the body, and other organs in the body of some types of nasty animals, and the organs animals they love it.

With several nicely fermented brews, force feed the Dhourty, about a cup an hour, if you can, or build up to it, and then continue to force feed the person, for several weeks, about eight and a half weeks, should be enough time. You can tell if you have fed the person enough brew, in addition to light snacks, now and then, for normal nutritional needs, when the person's pee begins to smell of the brew that you are feeding the person. The person will begin to leak fluids out of his 'pores', or the openings and ports that the organ animals exhale through, pee through, poop through, and inhale through, etc.

When the person begins to smell of the brew, also on the surfaces of his or her skin, and it should be very clearly distinct, and any body with a nose, should be able to detect it, the odors of brew on the surface of the person's skin, and in the person's naval, and in the person's, butt hole, and in the person's pee hole, and if the person is a woman, in the person's vagina, and in the person's lactate juices.

When the person has sufficiently swallowed brew for several weeks, and when the person smells overly filled with brew, even after taking a nice shower, the odoor should be almost immediately apparent on the surfaces of the person's body, then the person is ready for a test trial.

You can take the person, and saw the person in half, and the top half will continue to be connected to the bottom half.

A person's leg can be sawed off, as carefully as possible to keep nerve animals from being ripped apart, and to keep other animals from being ripped apart, and so you want to do it, surgically, and be as careful as possible.

When you have the leg sawed off, then tickle the foot, or toes, and the person will feel you tickling him or her.

The connections stay connected, despite the fact that you have sawed off the limb. This gives us the possibility for many interesting experiments.

You can grind up the person's leg, in a meat grinder, and keep all the ground up materials in a beaker of brew. Next, tickle the foot, or toes, and the person will still feel you tickling him or her, and the person will begin to laugh, after the person recovers from the pains of having his or her leg ground up in a meat grinder.

So, if you use your imagination, you can come up with all kinds of experiments to have hours of fun and enjoyment with, while learning how these things work.

Some times, an organ animal, may die in the process, and the connection might be lost, to some extent. However, if you keep the leg wrapped in a cotton towel, and pour brew with molds nutrients of one type or another, in with the brew, with salt, and extra sugar, and a little cream, you can feed the organs animals, and they will happily reproduce for you, a replacement organ animal, for the one, or ones that were accidentally lost, i.e., the one's who accidentally died, and then went on to their next job assignment.

This experiment may be practiced on parrots, dogs, cats, lizzards, canaries, and so forth, until you have gotten the hang of it. Once you've gotten the hang of it, then use your imagination, and see if you can't get a dhourty to become friends with you, and give up his or her affiliation with the Lesbianists, and then, come on over to your side, to cooperate with you. If you experiment on enough Dhourties, you will eventually find some people, who will wish to sign a statement denouncing their organization, renouncing their codes books rules and regulations, etc., and terminating their affiliation with their organization. Once they swear to terminate their affiliation, and once they swear to leave their organization, and then swear to assist you and all other Dualdigers, normal people who can remember their birthday, within the last one hundred and thirty or so years, at max, generally, then you should be started towards having a good relationship, with a few former Dhourties, now that they have changed sides, and joined our side, the Dualdigers' side. I explained a little about how we got the name dualdigers, but there are other meanings to it, as well, and you can ask your dhourty friends for a fuller explanation.

Once you have some 'former dhourties' on your team, you can ask them for a better explanation, and better proceedural methods, for experimenting and for having lots of fun.

Invite your 'dualdiger' neighbors, and your 'former dhourty' friends, in for the experiments, and see if you can't all have a good time, having lots of fun, exeprimenting on your new 'dhourty' guests, all the time, and see if your 'former dhourty' friends know some other interesting experiments they can teach you, that will widen your and your friends understanding of how things actually work with regards to the human body, and brains, etc.

Organ Animals Updated: 29-09-07 Rev.x 18:38 PDT

When you develop your body's health, and start to bring back your body to an online status, with all the organ animals being fed regularly inside of your body, with the foods you select that are good for them, and that will nurture them, as well as you, as I've explained about, a little, on my bulletin board, you will begin to feel some or another of them pumping, a little here, or a little there, or a little over here, and so forth.

You might feel them in your feet, or in the arch of your foot, or in the side of your leg, or in the side of your body, and in the side of your chest, as you lie down, on your side, or in your bun bun, that is your butty butt, or in your tummy, and so forth. You might sit quietly, after a few months of feeding them, and see if they are moving or not.

If you concentrate, on a specific part of your body, that you feel may be moving, or seeming to move, it may start to pulse, stronglier and stronglier, a little at a time.

This is your organ animals excercising methods. They will pulse, and pulse, and pump and pump, and this is how they get their excercise. They are in fact, orgasming.

It sounds funny, but it is true. Your heart pulses, and that is, it orgasms, constantly, or at a constant rate, more or less, even though it picks up when we excercise, harder, and run, and jog, and so forth. So will all these organ animals, one by one, as they come on line, and get into business, they will all begin to pump, or orgasm, living in your body, as you feed them the foods they like to eat.

It sounds very peculiar to most people, perhaps, that we have a body that has animals living inside of it, pumping, and orgasming.

Well, after a while you will get used to it, that you have organ animals inside of you, and in time, maybe few years, to more than a few decades, or so, you will slowly accept the fact that they are in side of your body, and that they are feeling good, and that they are pulsing, and that they are living inside of you.

So long as you feed them the foods that they like to eat, the molds from breads, and from milk you mold up at room temperature with some of your nicer and more useful molds, and from yogurted milk, and from your own cream cheese with new molds to help the cream cheese that you buy in the store and remold up at room temperature in your home, and from cottage cheeses made from scrap or from a container of cottage cheese from the store, that you strain the curds of the creamy but useless and poisoned liquids out, and after you have strained them in water, put them in milk and add some heavy whipping cream and with a number of good, useful molds, you make your self some nicer cottage cheese than they will sell to you in the store, and add some ocean salt and raw sugar to the milks, and bananas are good too, as they help kill the stricknine animals, and the arsenic animals, and the cyanide animals in the milk, make up molded cheeses and feed them to your organs animals, and feed them the brews that you make, with expert help of course, and eventually, you'll get lots of animals all well fed inside of your body.

If you do not know how to do this, without getting your self ill, you may suddenly stop breathing, and you may end up in a morgue, to find your self tagged as 'deceased', and then you might get up to find them waiting there, in the lunch room, with a knife, ready to kill you, before you can escape the morgue, to tell the news papers - a foolish idea - that you came back to life after dying, and you found your self in the morgue, tagged as 'deceased'.

Well, any way, funny things will happen, but do not kill your self by eating the molds that you are not supposed to eat, and that are not suitable for eating, such as stricknine loaded molds, and cyanide and arsenic loaded molds, and other such molds that will also put you in a state of slumber, with out your heart beating, and without your brain very active.

Your animals inside of you, will come to your rescue, because they do not die, even if you stop breathing and pass out.

They will generate enough gasses to awaken your silly self, if you ate some thing that is not good for you, after they clear it from your body, and then rescue you. They all have hearts, and just because your heart stopped, and just because your brain activity went very low, their's did not. They are alive and well, and you will be rescued, if you are waiting, undisturbed, long enough.

It is not a good idea to experiment on your self, and so use a dhourty friend, you've captured, and are in the process of training to be a sexaling slave, or use a pig, police officer, fire department worker who is a dhourty as not all are, but most are, morgue worker, hospital mortician, city mayor, congress men, congress woman, vice president, president, parliamentary member, prime minister, or other animal.

I am looking for a Radio Industries Loudenboomer Mark II schematic and manual. Would some one have a source for this documentation? I have the amp several 4-300Z tubes but no power supply.

I would love to get this vintage boat anchor back on the air.

Thanks,
Paul P.

Is this chassis the same as the Hallicrafters HT-45 that I found on BAMA?
http://bama.edebris.com/manuals/hallicra/ht45iia/   Is the relay in the
power supply or on the amp chassis?
If so any ideas about a convenient power supply?

Paul P.

Hi Paul:

The Loudenboomer was acquired by Hallicrafters, so the HT-45 and the Loudenboomer should be very close to the same.

I do not have the manual, but the power supply should be conventional. Probably about 2,500 volts for the plate supply. The filament supply generally is on the amplifier chassis - to eliminate voltage drop on the high current filament cables. Only other thing would be the bias, and that is often supplied by diodes in the cathode - or zero bias.

In short, you can copy almost any high voltage power su0ply for a similar tube final. There are a few high voltage transformers with high current that are only 120 volts. High power guys avoid them like the plague and you can get them often for hauling them away. It will suck power out of a 120 volt receptacle like a 1500 watt heater, and if lights do not dim when that happens, you should be ok.

The Loudenboomer was a pretty amp - although i recall it does not have tuned input. You may want to build insert a tuned input if you are using a solid state driver.

73, Colin K7FM

Thanks, folks, for your discussion and links. I'll first try the matched tubes listed at Antique Electrical Supply or RF Parts--that would save me a lot of work and some expense. Of course, with these old rigs, expense is not the prime consideration...

My Drake 2B has a case of what I think is called backlash. If I move
the dial ever so slightly and let go of it the knob tries to return to
its original position. The vfo frequency does not seem to change very
much, not as much as the knob does. In other words I can tune in a
SSB station without much difficulty, but if I atttempt to make tiny
changes (to really fine tune the station perfectly) it is almost
impossible.
I don't see what causes this. I thought maybe it was due to sticking
in the vfo capacitor so I went in there and cleaned the bearings of it
- no help. I also cleaned the rail that the dial pointer rides on -
no help either. My thinking is that this is due to friction somewhere

but I can't seem to see where it might be dragging. Any ideas as to
what causes this? Thanks
73

A few years back, I ran into a fellow who was familiar (he figured it out)
with this procedure. I think he was from Texas.
Is there anybody who knows how to do this? Unfortunately, the service manual
doesn't explain the adjustment sequence.
Thanks!

Pete

FS Alliance Tenna-Rotor Model U-100 is a light duty rotator and handles small to medium size VHF/UHF ham antennas and TV antennas. This rotator and control console look to be in good condition, but do not work. The control box does not activate the rotor. They look like they have been used very little, so probably an easy fix. Price is $25 plus shipping from 79602.
Thanks, Charlie Hugg,
K5MBX

Rick,

I am not familiar with the 2B however I have found dial cords tend to elasticize with age, stretching instead of driving the pulley assembly. If the 2B uses a pulley/dial string arrangement you may fix the problem by simply replacing the dial cord. I've experienced the same backlash effect but it was remedied with fresh string.

I am almost embarrassed to suggest my other "fix" for the problem. Make sure the skirt for your dial knob isn't rubbing the front panel. I'm sure you've already done that and forgive me for suggesting otherwise. :)

Good luck.

W9STB

If it's a dial cord problem (and by your description, it probably is),
go to:
http://bama.edebris.com/manuals/drake/2b/   This is a full receiver manual.
There's a page showing how to string the dial pointer and spindle cords.
To read the file, you'll have to download LizardTech's DejaVU program,
which is available at the site.

I was one of the many who owned a 2B and always regretted getting rid of
it...

Hi,

I had a similar problem with my Drake 2B, and figured it was due to dial
cord slippage.
I rubbed a stick of GC Electronics "Dial Cord Dressing",
part number 1212, on the dial cord, and the problem disappeared.

The product is like a sticky wax candle or crayon. I don't know
if they still manufacture it.

73,
Ed Knobloch

Can anyone supply the specs for this one? Is there an online source for
older Hammond transformer specs?

Thanks,

Steve

It might work.  I remember reading a tip ( I think in Pop Electronics
```

'way back) to use the rosin flux residue from rosin core solder.

At Sony we used beeswax which is what the GC dressing is. Your wife may
have some in her sewing basket, or you can get it anywhere where they
sell thread.

The "0" call district was created at the request of ARRL.  Perhaps a
note to them could provide the information.

Rude of me not to tell you folks what the problem was. The actual problem turned out to be a broken connection from the bifilar wound RF output transformer.

Pete

What is the lowdown on this receiver's performance? I've
read that the parts (display, etc.) are unobtanium, and that
TenTec doesn't support the product. But, how does a good
example perform? Are they well engineered, or something
similar to the low cost Drake entry level receivers of yore..

Pete

The pick up broadcast and short wave stations. They work better than the
S-38. Ten Tec made them to meet a bid price. They were not proud of them.

I would not sell your R-390A to buy one. They are something you would
expect from Radio Shack.

If you do not buy it, you will not regret it.

I don't quite agree with the above.

I find that their selectivity is good, their stability is excellent (with ovens for the internal oscillators) and the sensitivity is good.

They do fall down a bit in terms of image rejection and IMD products on the higher frequencies.

Show me the Radio Shack product that had excellent synthesis, selectable filters, memories and ovens for the crystal oscillators?

I currently have one and what I'd compare it with, in my experience, is to an UPGRADED Yaesu FRG-7. I'd added tighter ceramic filters to the FRG-7 but the Ten-Ten SP-325 was still better and of course had digital readout that the FRG-7 didn't have.

The comment that the vacuum florescent display and driver chip are not available is true. I recently picked up a recent driver chip as a spare. However, its firmware must have changed and it lit the display in a wrong sequence, thus I'm still stumped in terms of a substitute.

While the audio output was designed for line level 600 ohm operation, simply bypassing the 8 ohm to 600 ohm internal transformer solves that and gives one a watt or two of audio output for speaker operation.
The previous owner of my SP-325 had gone to the unnecessary trouble of

installing a T-Kit audio amp PCB to get speaker level output. I
removed that useless amp and did the above transformer bypass in my
unit.

Now, the fact that Radio-Mart is selling it is another topic...

Ah... this Ten-Tec SP-325 Receiver has been Anointed
and "Cleansed" -a la- Radio-Mart.

another perfect mystery of modern technical healing
that could only happen on ebay ~ RHF

I may have overstated the "ordinaryness" of the SP-325, although I did have a Radio Shack receiver that was about the same as the FRG-7 and SP-325.

There are plenty of other receivers I would rather have as a communications receiver, though, and it is not the equal of a Drake RX-340.

In fact, the RX-320D is a much better receiver and is available brand new for $359.

But, that is only my opinion. Maybe I am a bit prejudiced because Radio-Mart is selling it.

I have a homebuilt regen receiver that I love to use for short wave listening.

Have a quantity of Test Equipment and Radio Communications Service Manuals, both Commercial & Amateur
Most of them are in Like New Condition.
Prices are reasonable...mailing may more than the manuals..depending where you live!

Please check my site: www.rodemi.com   for what is available.
Click on the MANUALS Heading.
I am updating the site as time allows.
I recently retired from the Commercial 2-way radio business and would like these useful manuals to find a good home.

Thanks for looking....Norm VE3CZI
Email me Directly: <insert Call Sign> at arrl.net ....<call sign> is ve3czi

I agree with both your posts, for the most part. A friend of mine got
one very cheap at a garage sale of all places, and even for $200, it was

pretty poor. With my sloper, there was a lot of intermod, and it was
noisy, to put it mildly. It looked like it had just come out of the box,
and my friend sold it at a hamfest for $250 about a month later.

My $200 Yaesu FRG-7700 was light years better, even with the tobacco
orange stained cabinet and stink it had..

It's 50 years Sputnik 1 was launched. And pretty much all it had was a few transmitters keying on and off carriers at 20.005 and 40.002MHz (when on was off the other was on) and the rate of keying was related to the internal air pressure inside the transmitter housing (they use convective cooling). I would imagine that they used a few vacuum tubes, probably filament "pencil" tubes, as transistors were not enough advanced to run at these frequencioes. I've seen pictures of the physical hardware boxes, but are there any diagrams of the circuits used on the web?

I suppose a satellite is the inverse of a boatanchor. :-)

```

I just got it out of storage from about 8 years ago, it's a Wabash Deluxe Model 1158 amp in a tweed case made by David Wexler & Co., Chicago with an Electrovoice Wolverine LS-15, 15 inch speaker. It has two chassis, and upper and lower.

The lower has a 5Y3, 2 6L6GB, 6SN7, 12AX7, and 6JS7.

The upper has 2 12AX7 and several inputs and controls.

Left side is a jack for Tremolo and 2 pots for Speed and Strength. Next is 3 jacks for Guitar or other instruments along with a Bass, Volume and Treble control.   Then to the right there are two identical areas each labeled Microphone or Accordion along with respective Volume and Tone controls. After I got it, I could find nothing Googling, same result today, must be a rare item.

I need to get the dust and crap out of it and bring it up slowly with a Variac.

If anyone has any info like a schematic I'd sure like to know.

tnx

Hank WD5JFR

I have just sent Thomson a certified letter requesting clarification of the status of this title. It's extremely doubtful, but possible, they may issue C&D to the servers offering it. If you want it, on .pdf, DOWNLOAD IT NOW.

If they do, they won't bother anyone who has it if they don't publicly distribute it. Copyright is challengeable if it exists at all because it's been out for years and they did nothing.

What in the world are you babbling about?

OH! RADIO DATA HANDBOOK///

Do you figure Thomsen owns it because they bought some portion of RCA
Corporation?

If so WHO owns that part of Thomsen now?

Aren't copyrights for written materials from the early days 75 years
or something?

Are you going to make me search fro stuff I'm not gonna find a lot
about?

Tune in next time to As the Transformer Burns and find out!

I need to replace some capacitors in a boat anchor receiver. These caps are across the power supply rails on a logic circuit board. They are marked "227 +10K". My interpretation of that is 220 MF. at 10 VDC with a 10% tolerance. Does my interpretation sound correct?

Any suggestions for a replacement? If I use tantalums will I be doing this again in 20 years?

Thanks,
--

Sorry, Radiotron Designer's Handbook, Fourth Edition.

In reality it's almost certainly public domain-almost certainly as in

almost certainly they really went to the moon or almost certainly
Marilyn Monroe met with some foul play. But a nut named Andrew McCoy,
alias Andre Jute, has wrecked our group with pissing about how it
really is not public domain, so I have had to "settle the matter".

If you don't have the .pdf, you might want to download it now.

 One can only steal what can be stolen, and only what is owned can be
stolen. No one owns RDH 4. Not Newnes, not Audio Amateur Productions,
not Thunderfunk Amps, not Thomson, and very certainly not Andrew McCoy
d/b/a Andre Jute.

 If any one did own it they would have issued a C&D by now. They have
not because they do not. They will not because they can not. At the
very least they would have allowed free distribution only with
attribution, which they have not asked for.

 You are a liar, a thief, a mountebank, and probably a mattoid,
Andrew.

Replacing paper caps, electrolytics, and out of spec' or stressed resistors
is part of doing a restoration.

>
> My question is, what's the worst that's likely to happen if one doesn't do

It sounds like you want to hear you should take the easy way out.

> Some have said you can blow the power transformer but wouldn't the fuse
> blow first (unless the power transformer was ready to go anyway)?

Are you a gambler? You're bias supply could fail and take out the final
tubes;
the transformer could fail; cleaning the mess after the electrolytics
explode is always fun.

And, you can't reform the caps using a variac... There's no cathode emission
from the rectifiers until the AC supply is above a certain voltage.

Depends on the radio.

In the case of receivers, interstage coupling caps that are paper can fail into a short, and take out an IF can. You can't get replacement IF cans easily these days. So this is a catastrophic failure.

Transmitters are less apt to have delicate things like this to fail, but they also have less delicate things that are more dramatic when they do fail.

>Some have said you can blow the power transformer but wouldn't the fuse
>blow first (unless the power transformer was ready to go anyway)?

Sadly, not. Especially if you run the rig for a long time with the transformer overheating but the total current below the fuse current. Remember, the fuse is sized to allow a large starting current in most cases.

Using an inrush current limiter allows you to use a smaller fuse, which protects you from such things. I recommend this in newer designs but of course it's not in place in most boatanchors unless you retrofit it.

Also realize that when can caps fail, the resulting shrapnel can sometimes damage plenty of other stuff.

>General question... which is the best website for information on restoring

I don't know.

What is the power cord on this?  Is it elliptical, with two or three round
pins?

Excellent advice; and the ICL get's rid of the transformer "THUMP"
when the rig is switched on at the crest of a cycle.
It also does a lot to enhance the remaining
power switch contact point life.

Pete

>> It sounds like you want to hear you should take the easy way out.

Good afternoon, Uncle Peter.

I have been on the Internet since before most people knew the Internet existed, and I have always wondered what it is about Usenet (and Fidonet and RIME and all those BBS networks that came before the Internet) that makes people feel compelled to put other people down for no good reason.

If we were sitting around the shack here, talking about this stuff over pizza and some cans of beer, would you talk to me like that? Maybe so ... but really I suspect not, you don't strike me as that type.

I would think by now that regulars on this NG would know that I'm new to this stuff and am just looking to learn.

There's "taking the easy way out" and there's "not fixing what ain't broke".

I'm currently working on a DX-40 restoration and I have been advised to strip out all of the components and wiring and rebuild it from scratch with all new components (where available).

Seems like a bit of overkill to me.

Saving the bias supply, and protecting other components from shrapnel when a capacitor blows, all seem like good reasons to replace the caps. So, I learned something today, just like I do just about every time I post something here (thanks).

(On the other hand, bias supplies fail for reasons other than blown caps...)

I'll try Phil Nelson's site ... thanks...

What can I say. You asked for advice, and still doubt the veracity of the advice. "Fixing what ain't broke" pretty much conveys the original supposition of taking the easy way out.

A proper restoration involves changing parts that WILL fail, and that includes electrolytics and paper capacitors. If you just want to get it running, then you take your chances.

If you've been around that long, then certainly know what to do without asking for blessings. And yes, this is usenet.

Seems like I was one of the first that responded on thread as well. I don't
remember advising you to strip all of the components and to rebuild it
from scratch.. But, on the other hand, if someone was doing a full
restoration that certainly wouldn't be unheard of. Most of the advice
you received was pretty much on the mark. Again, if you ask
for advice on usenet, I suggest you either develop a thicker skin or
keep a more open mind.

Hi Rick,

Communication is a two way street. What appears harsh to a reader might have seemed harmless to the sender. I have been told that I write mean. That surprises me, because I am a nice and gentle person. I suspect that what bothers some people is I work hard to make sure that my posts are as grammatically and factually correct as I can. That means that I have lots of details in my posts, and lots of things that might appear as being condescending.

When you read some one's post or reply, imagine that they aren't trying to put you down. 99% of the time you will be correct. Imagine that writing might be a bit challenging. That will also get you another 99%, if school scores are any indication. Keep your skin thick. That way when someone does try and make you feel bad, you will be as immune as possible to their bullying.

Uncle Peter is a good guy. I don't think he meant to be rough with you.

-Chuck

Get a free TV with no credit card. Follow this link and sign up where it says Start Here. Then sign up for an offer I recommend ebay (or FastWeb if it works on your computer) because you don't need to give them your credit card # or pay anything. If you choose ebay create a new account and bid 99 cents on something very expensive like an iphone or ps3 so you are guaranteed to lose.

Good evening, Chuck.

Yeah, I know... he seems that way most of the time, which is why I kind of wondered why he felt the need to say what he said. Believe me my skin is plenty thick :-) ... usually I just ignore things like that, knowing that's the way things are around here. Every once in a while, though, something hits me just so and I have to ask myself why in the world so many people seem to find the need to say on Usenet what they would never say to someone's face.

It's nothing new. I'm an old Fidonet sysop from the 1980's and people did the same things back then. Never quite understood it then and don't really fully understand it now, but yes, it's the way things are, and just about all the time I just suck it up and move on.

As Pete said in another message, "yes, this is usenet"... as though that explained everything. Maybe it does.

No big deal. :-)

Thanks...

I could use a couple of parts for my HQ-180A ... the antenna trimmer capacitor, and the S-meter sensitivity pot (the 1.5K screwdriver-adjust pot that mounts to the back panel).

I could (and will, if I have to) use modern parts but I'd kind of like to keep the radio as original as I can.

I googled on "HQ-180 parts" and several variations thereof and sent some email to several of the hits I got from there, and none had the right parts.

So, if any of you has a parts chassis for the 180A and would like to sell me those parts, look me up on QRZ and drop me an email... thanks...

Scott:

It is two-pin cord very similar to the old AC "cheater" cords used to when servicing 60's radios and televisions.

I am in the middle of building an unbuilt Marauder.
The circuit is very similar to the newer, smaller SB400,401.
But....the VFO dial arrangement is a nightmare.
I would almost bet that an almost 40 year old transmitter has more than few
problems lingering!

...Dave

I am pleased to announce to this illustrious group that there will be a formal get-together of R-390A enthusiasts at the NEW ENGLAND AMATEUR RADIO FESTIVAL (NEAR-Fest) on Friday October 12th 2007 at 5:00PM.

This event, called The R-390A Receiver Workshop, will be hosted by George Rancourt, K1ANX.   Known and respected throughout the amateur, commercial, and military radio communities for his vast knowledge and expertise, George is recognized as one of the top R-390 gurus. He brings several decades of hands-on experience and skill to the table, and we are very fortunate and pleased to have him share his wisdom and experience with us

Full information on The R-390A Receiver Workshop as well as the other Forums and Symposia can be found on the NEAR-Fest Web site:

http://near-fest.com/index.php?topic=170.msg630;topicseen#new

Full information on NEAR-Fest may be found at:

www.near-fest.com

Hope to see you there.

73,

W1RC

The Rx100 scale on my old Simpson 260 VOM zeroes nicely, but the Rx1
scale won't zero even with new batteries.  I haven't looked inside,
but is there an internal pot or something I can tweak so it can be
zeroed on the Rx1 scale?

> The Rx100 scale on my old Simpson 260 VOM zeroes nicely, but the Rx1 scale won't zero even with new batteries. I haven't looked inside, but is there an internal pot or something I can tweak so it can be zeroed on the Rx1 scale?

Check the resistance of your test leads. They may be more resistive than the meter has zeroing range.

Also check the battery terminals, sometimes if a battery is allowed to leak it will wreck the low resistance contact that is necessary for the Rx1 range to work. The battery is sourcing pretty high current in this range.

-Chuck

Put a really good short right across the banana sockets and see what
happens.

It could be a bad contact on the battery holder or the range switch.  R X 1 uses a
lot more battery
current than R X 100 so that small internal resistances matter.  The usual case is
that someone
attempted to measure voltage on the R X 1 setting.  There are probably burned
resistors in the
ohmeter circuit. There is no internal adjustment for R X 1, AFAIK.

Hello All,

New season, new project. I have a rusty, gritty BC-610 in the shop. Somebody has really cranked down the setscrews on the 'bandswitch type' knobs - the same ones used on the SX-28 for bandswitching. They are circle-and bar, with an 'h' in the middle.

Anybdoy have a couple such knobs that they would part with?

Again, thanks for the help, USENET - many old rigs of mine have been completed due to this newsgroup.

David Goncalves

Get out of the Ghetto

I am finding that when the 80 meter window is stuffed beyond capacity and no one seems to want to move down the band that the 40 meter window is silent as a tomb.

I have been told that it�s the sunspots and propagation but just wait a few years.

I say nonsense. There are plenty of sunspots and propagation for the 7290 Net to fill up most of the day so we know at least there is propagation to that area and the few contacts I have made range from East to West Coast at night.

I would like to propose a couple of schedules to get folks to use 40 meters as an alternative to 80. This is not a net, just a particular time to get a QSO going.

The following fits my evening schedule:

07:00 CST �. 01:00 GMT
09:10 CST�. .03:10 GMT

I was told that the Noon Time Forum on 3875 could not work and it has worked just fine for almost a year now. We have had over 100 checkins and from 5 to 10 every day since startup.

A net won�t work on 40 because of propagation but we can at least use it for what it is worth which is to open up to a whole bunch of AMers who can not be reached on 80 meters.

I will be there at the above times listening and calling CQ for as long as it takes to get something going or to get bored.

Let�s start a new ghetto.

No, it's either a (very) bad connection - or quite possibly a cooked R16
- check it - it takes a beating in 260s (should be 11.2 ohms)...

regards,

<Notes use of the term "Amateur">

> We're not your average usenet idiots.

LOL OK.

> Fuck with us and we'll report you to the proper authorities.

You mean AOL? <snicker>

But seriously, I haven't broken any laws, so good luck with that whole "reporting" thing.

> We provide valuable communications during emergencies

Excellent. Continue to do so... as opposed to bitching at me just because somebody crossposted
one of my posts into your group.

> DON'T FUCK WITH THE RADIO GROUPS OR SAY BYE-BYE TO YOUR ISP!!!

Don't worry about that, hun. I'll forward this little memo of yours over to them, RIGHT NOW.

See? All the work will be done for you. :) You're Welcome.

I have a Drake TR-3/RV3/AC-3 combo that did well for me in the 1970's.
It was designed for a matched trio of 12JB6 sweep tubes as the final
amplifier.
Obviously, these bottles are hard to find, and a matched trio even
harder. It's to a point where the current finals can't be neutralized.

Has anyone rebuilt the final amp section with currently available tubes,
such as a pair of 6146's? I'm open to try something like that, since
the rig is still in fair shape, had good audio "punch," and could
probably have its selectivity improved by an audio DSP program.

I'd appreciate the benefit of your knowledge and experience.

It should not be difficult to convert the finals to the 6146 tubes. There
is an article in Hints and Kinks, I recall, on converting another rig using
sweep tubes to 6146s and it would be helpful.

The conversion should be quite straightforward and I would be willing to bet
that it has been done before and information should be on the internet.

In fact, you could probably use one of the 12 volt type 6146 tubes, which
are even cheaper than the 6146 types.

73, Colin K7FM

There are three or so popular variants of these with different diameters
and pin spacing, but Ace Hardware carries most of them.

The Belden one with the rounded corners is no longer available (not even
from Volex) but one of the Ace ones will fit with a little surgery.

You might check with Antique Electronics Supply and RF Parts -- both of them at one time would match sets of 6JB6s for a fee ($5.00 per tube?). Also Bruckner Components (http://www.powertubes.com/5Rcvg.htm) may be able to match a set for you.

There was a guy who did this for the T-4X transmitter. The link below
describes it but I can't get it to load at the moment so I'm not sure the
article is still there..

http://www.qsl.net/k5dkz/t4x6146.html

And, of course, there's the Drake list at:

http://www.zerobeat.net/drakelist/

OM, I might recommend that you perhaps try and use some 17JB6's in your rig. The idea was suggested to me a number of years ago and was implemented on a rig in Brazil, owing to obvious logistics problems of locating the original tube type. They did work, albeit the power was down somewhat, as I recall. I've seen the 17-volt tubes for anywhere from $3-$4 each to around $10, each. I bought some as back-up for my T4XB, in the event 6JB6's become extinct. Just a thought..........

Seems to me that there aren't any breeding pairs of 6JB6's around anymore,
so they are already extinct ;-)

Cleaning out more:
Quantity of some 25-30 pulls and OEM, all tested for proper resting current
so no duds or shorts.
Open to offer for all -- partial -- or swap something useful to me. Yes of
course they will replace 4CX250B and other series at 30 % lesser power
output thru 400mhz. may have a few un-shielded sockets & chimneys also.
Will have some of these and lots of QRO new & used PA parts at Elmira, NY

It certainly does look a bit rough. But I suspect there are not that
many Maurauders out there. Certainly there are many more DX-100s around.
How long have you been looking for a Maurauder? How often do they turn
up for sale in any condition?

I used to collect rare records, and I learned the hard way that when you
find something rare that you really want you should just buy it, because
the next time you see it the price will be even higher. Condition is
always a factor, but you can do a lot more to fix up a beat up piece of
electronics than you can do with a record that has been abused!

The price is less than what the kit sold for 45 years ago. Considering
what other equipment of this era is now selling for, it seems pretty
reasonable to me even in this condition. If it's working as well as the
seller describes it may need nothing more than cosmetic attention.

Just my $0.02 worth. YMMV. Good luck!

John

I owned a Heath Marauder many years ago. They are known
for weak power transformers...

One other problem is that Heath put the SSB filter
on the input side of the IF amplifier... The transmitter
has a bit of broadband white noise either side of the
carrier. If you ever run one with a VHF transverter
the locals WILL let you know about it :)

I think this point is valid. I wasn't around the hobby at the time, but
from reading the magazines, it was sold for a relatively short period.
They then switched to the SB line (or maybe there was something in
between) which was far more compact.

Heath tended to do that, keep the same basic equipment but change
the cosmetic look (with some internal changes) over the years. That
the SB line lasted so long is somewhat a surprise, but even then, it
there were at least three "editions" within the line before the dramatic
change of the digital one, was it the SB-104?

Michael VE2BVW

A neighbor gave me a Heath DX-40 transmitter and VF-1 VFO that had been sitting God knows where for God knows how long, and tonight I pulled them up into the shack from the garage to see what if anything I could do with them.

You can see the "Before" photos at http://www.rkt-tech.com/DX40 (at least for the transmitter ... I haven't taken the VFO out of its case yet).

You can see that it needs a little work. :-\

(Amazingly, though, the underside doesn't look half bad...)

Having never done one of these restorations before ... where do I start?

I know ... "First, get a medium-size trash can and lay them both gently within...". I also know about what they'd be worth if they were in good shape... not nearly enough to justify the work. Still, I would like to see if I can get them running just to see if I can.

What kinds of cleaners can I use to clean the cabinet (as best it can be cleaned) and the top of the chassis, that won't eat the paint from the cabinet or damage the components inside (assuming any of the components are any good)?

Then I guess I'll need to find me a variac... pretty sure there's one around here someplace...

You're kidding about the garbage can, right??? If not, I'll take them off your hands!

I'd definately replace the DX 40 filters to start with. 40 or 50 year electrolytics
are garbage, even you can reform them... Spend a few bucks and do that part right. Any other electrolytics or paper caps should also be changed.

Check the resistors for obviously signs of overheating. You could do a quick ohmmeter check to see if any have shifted upwards in value while you're at it.
The little VF-1 probably could stand a quick alignment, not much to go wrong with her! You might check the tubes, but if the transmitter makes power then you are good to go. Clean the cabinets with soap and water or some Fantistic spray cleaner. You have the start to a real nice classic station; enjoy it and
treasure it.

Remove the tubes and scrub the chassis with
an old toothbrush and some cleaner after blowing
away the loose debris...

Be careful not to get any liquids into wafer sockets.

The cabinets might need to be repainted, they look pretty gross.
If the front panels are good it would be worth the effort.

Too bad you weren't able to rescue those a few decades
earlier! I would do what I could to restore them if
they were mine!

I'll certainly second what's been said. The goop on the cabinets may well be removable with some of the current cleaners (to include Goof-Off, used with care!). You might even consider un-building the unit and clean the chassis up completely. The front panels don't look bad, at all, and you'll end up with a nice set of equipment. One can't judge the effort based on the dollar value of your time.. you'll lose that trade-off in a heart-beat! Its the fact that you did the job and the results that count... Give it a try. Any bad parts you might find, except maybe the power transformer, are readily available. Those two units are an ideal entry point for the restoration process....... de K3HVG

Cleaning and refinishing the case will be the toughest job. If the stain is corrosion then a replacement case may be an option [watch eBay]. If it is stained, a fine grit sanding followed by little spray paint [AKA Rustoleum Gray] will provide a decent finish.

Electronically, change out three electrolytic capacitors in the DX40 before you even think about applying power. The two orange/tan electrolytics shown in your photos [basic power supply] and the blue one at the lower side [300 VDC for oscillator, etc.]. I used LTE electrolytics. The LTEs have different physical configuration but were useable and inexpensive.

Get some contact cleaner and a small moderately stiff brush [solder/resin removal brush 5 for $1 variety] and liberally spray all the switch contacts and brush the wipers down to remove any 'dark' stuff. The T/R contact may be pitted. It breaks the HV power and sees a small spark when operated. Mine is pitted and still works fine.

Test the tubes, or have them tested. I picked up a complete spare set at a seasonal ham flea market for $20.

Vacuum the interior and a little burnishing should clean up the chassis.

Mine took about 3 hours to clean up and get operating. It cost about $35 for electrolytics and spare tubes. I've used it on 80/40 CW and 75 AM phone. [It is a little pistol on AM phone though].

It is a nice rainy day project when there are no sports on tv, XYL is out shopping with your daughter, and the lawn mower needs repair.

NOTE: Fix the lawn mower after the restoration :-)

/s/ DD, W1MCE

Yes, very much... that's exactly what I was hoping for.  The BAMA Djvu
and .pdf files are okay, but one does not show a decimal, and the other
shows only a vestige... not much more than a pixel.  If you blow it up
enough
on a graphics program, it's visible.  That's a hazard with using scans, I
guess.
Along with some other things, it seems the primary on T1 got cooked at
some time, and the rewind job was simply hand-spinning some enameled
solid on there.  It's in very good hands now, getting what I expect will be
an excellent rewind... although we're still working out turn count and wire
gauge for it.
    Nelson

The metal cabinets are not that bad. Any half decent paint booth at a good
autobody shop can remove the rust prime and paint in yoru favoriate gray to
match.

PATIENCE is the kep skill for restoration work. IF you don't have that --
pass these on to someone who has it.

I always liked the restoration project described in QST some years back
(I gues more than "some" at this point). He basically stripped the
transmitter down, I think it had started out as a kit, fixed up
the chassis (and had it commercially plated) and then started building.
I seem to recall he used quite a few new parts, like all the resistors
and capacitors, perhaps event the tube sockets.

He probably did end up with a more reliable rig, though I'm not
sure how it gets classifed.

The underside of this rig looked pretty damned clean to me - unless I missed anything. The top looked (to me) like a good vacuuming was in order - maybe some cleanser. The case - looked the worse for wear. But - as others said - nothing not able to be done. NICE project!

If you're so inclined, and the re-wind isn't successful, give me the p/n
on the can and I'll see if I have one, here. I've had to scrap several
beyond-all-hope Hammarlunds and maybe I have the correct can. de K3HVG

Same here.

Since the Hammarlund file is only one-third the size of the Johnson file, maybe
something failed on the upload?

```

OK, I reUPLOADED the Hammarlund catalog. Try this link. Hope it works
now. Thanks for letting me know. If it still doesnt work I will try
something else. 73, Randy

OK, its still not working. I have asked for help from MediaFire and I
will see what they say maybe the problem. It had been working well up
till recently. I will try again after I find out what is going on.
Thanks, Randy

There are scant few choices if you are looking for a AM TX with high level plate modulation as well as SSB.

You could go with a Johnson Ranger or DX 100 + a SSB converter.

A good inexpensive SSB TX is the Drake TX series. It does AM using controlled carrier. I have the T4XB & it is excellent. The Collins S line (pricey) & the heath SB units (variable build quality) are less desirable alternatives.

A very rugged yet inexpensive plate modulated AM TX is the Johnson Viking II.

Another super cheap alternative (if you could find a good working
unit) is the Central Electronics 20A. It works all modes including FM
as I recall. You'll need an amplifier as it doesn't produce much
output.

Thanks for the offer... I'll keep it in mind. After I sent the one
off for rewind I was thinking maybe I should have looked inside the
other three first. Continuity was good on all of them... but this one
had been "rewound".

Cheers,
Nelson

Well, I see we have another panix subscriber in the group. Yeah, I liked
those old tube radios as welll. I am blind, and had a hard time tuning
them up at times though.

Its not very pretty to look at, but its a whole lot easier to work on than any of that new gear out that surely has thousands of transistors and hundreds of chips (?).
>
> I chose the 813s and 811 and GG amps because both the 813 and 811 don't really need cooling fans (I hate blower/fan noises) and grounded-grid amps are notoriously stable (no neutralization headaches), and they are pretty cheap. I have several 813s, some made in China; one of the Chinese 813s had a filament that opened up on me all by itself after very little use (don't know if that is THEIR quality control or just a statistical fluke, but I thought I'd pass that along to y'all). I also manage filament warmup and cooldown on the 813s with a variac (up and down over abut 5-10 seconds), but not on the 811 amp. Been using the 813s + 811 for over a year (using the Icom 707 as driver) and just love how nice and quiet it is without fans/blower noise.
>
> Almost all of my old rigs are also pictured on that URL, and a couple of pictures of my "secret lab" out in the garage (heated with a space heater in the winter, cooled with a small airconditioner in the summer).
>
> I started as a novice in 1959. Had a Knight kit T-50 and Knight R-100 receiver, later got a DX-40. Mostly liked to ragchew with locals on ten meters AM at the time. Lots of find memories. Lots of SWLing.
>
> I'd like to hear from other homebrewers, HFers, ragchewers and learn if ther are any 75 meter nets for homebrewers/tubers/etc. I look at all this new gear coming out (for thousands of dollars) with hundreds of buttons, knobs, and "thangs" on them, and big thick manuals you have to read to figure out how to push the buttons (once, press twice, press and hold?, press and hold one, then turn on the power switch? Etc? Secret "reboot" buttons hidden somewhere. Built in DRM, DCMA, spyware? Too?). What happened to old-fashioned skill? 50 years ago guys worked the world with a crystal and a single 6L6 and straight key. Now, they are all couch potatoes in front of a black box that looks like its from outer space. ;-)
>
> I figure I'm within a week or two of getting the homebrew SSB exciter actually on the air. I've been testing the outputs of various stages either using the Icom 707 as general coverage receiver, one or two oscilloscopes to check generated signals, etc. Still have a lot of tweaking to do. Its been a ton of work, debugging and rebuilding when something doesn't work, but its also been an incomparable sense of accomplishment, too, when I get a stage to work and make progress (four steps forward, three steps backwards). Its also nice to have some test equipment (generators, meters, a good oscilloscope [had a Tektronix 922 that gave up and I tossed, then a heathkit which had a dead vertical amp that I fixed, and a BK-1420? very nice but now the horizontal sweep died but vertical amp still good, so I can probe at least for RF which gives me a vertical line [keeping the test equipment going is also a problem], and all of that stuff is also 30+ years old).
>
> After that, I plan to build a tube receiver and maybe even build a crystal lattice filter, and try to build a stable VFO.

OK, I have uploaded both catalogs to a different web file hosting
service.
Hopefully this will work ok. Here are the links.
73, Randy

How did you do that?  When I go to those sites, there are no
hyperlinks to download from.  Just a title with no hyperlink.

Dick

Randy
The Hammarlund file downloaded ok but I get the following on the Johnson file.
The same thing happens with Mozilla Firefox.
Thanks
Dave Foreman

Internet Explorer cannot display the webpage

Most likely causes:
You are not connected to the Internet.
The website is encountering problems.
There might be a typing error in the address.

What you can try:
Diagnose Connection Problems

Not sure why it works for some and not for others. I have not gotten
any answer back from MadiaFire so I do not know what the problem is. I
would suggest trying everyonce in a while and see if it will find the
target. I may try and setup my own web page where I can host the files
myself. These free file hosting sites is a lot of unknowns. I guess
you get what you pay for, HIHI.

Try using the original   http://www.mediafire.com/?axzcut2zdr9    link
for the Johnson catalog.

FWIW I can open both pages with both IE and Firfox. It may
be that the site is being blocked by a firewall or a privacy
setting although that should cause problems for both URLs.

Lots of snips here.
>
>Try using the original   http://www.mediafire.com/?axzcut2zdr9   link
>for the Johnson catalog.

Thanks
Using the original woked this afternoon and the download worked fine.

I don't have any problem opening the pages. My problem is downloading
the Johnson catalog. Hammarlund downloaded just fine. When I try for
the Johnson catalog, my computer just sits there without any download
activity. Maybe the server is just too busy.

Following up to my own, late message, I have downloaded them both
successfully now.  Thanks for posting them.

Dick

I have a line on an old Hammarlund HX-50 transmitter in unknown condition (been sitting on the shelf for years).

It would be a nice match to my HQ-180A.

General consensus with old radios like that, particularly transmitters, is that the first thing one should do is replace the old electrolytic and paper capacitors.

My question is, what's the worst that's likely to happen if one doesn't do that? Bring it up on a variac, a capacitor blows, makes magic smoke happen, XYL gets really upset :-), and the fuse blows.

Some have said you can blow the power transformer but wouldn't the fuse blow first (unless the power transformer was ready to go anyway)?

General question... which is the best website for information on restoring old radios? (I know I can google on "restoring old radios" but I'm looking for opinions on the best from among the few hundred thousand hits that are likely to come up.)

Thanks...

justmanuals.com is a well known spammer on news:sci.electronics.repair he is known for this spam tactic of post a link whether he has anything you need, or not. Just save yourself time and kill file him now. He will try it, again and again.

Rick, Looks like you've already stated the standard routine of
restoration, or at least the commencement, thereof. The HX-50 is not
super old so you may not have too much in the way of out-of-tolerance
resistors, for example. It doesn't take a lot to check an electrolytic
before actually bringing it up, assuming you've accumulated a
(e.g.:)Heath cap checker. Normally, bringing something up on the Variac
does give a bit of safety for the equipment, but not guaranteed. You
can still be in some degree of overload and damage may still occur. You
might consider putting a smaller than called for fuse in the rig and
bring it up, initially, that way. With no appreciable p.s. load, and
the additional protection, you may be able to safely test and/or reform
the electrolytics. Just a thought........

Sounds like a good idea, Thanks. How are you doing, Mike? Haven't heard
from you in a while. Randy finally gave up on r.a.r+p, so we don't keep
up on folks like we used to. Hope everything is going well.

Take care!

Does anyone have a suitable power cord for a Heathkit SB-301 receiver? I
have a restoration that is complete other than a power cord.
Please contact me a service@transistor-repairs.com if you have one
available.

Tnx Jim WA4BRX

Hi all,
    Has anyone got detailed and correct info on
aligning a Hammarlund HQ100? The admittedly
poor copy I have seems to advise tuning the RF
input transformer T1 at 6 mHz, which is impossible...
it's the BC band.
Maybe a decimal disappeared on this print?
    Hopefully,
    Nelson

Hi,

Possibly 0.6 MHz, or 600KHz.

Tuneup for most any RX is the same.... twiddle the coil at the low end of
the scale, cap for the high. At least so I was taught.

Cheers,
--
Gregg

0.6 Mhz. I recently aligned a HQ145 and the frequency for the BC band is 0.6 Mhz.

you can download the manual from BAMA. 6 mHz is correct for one part of the alignment. It doesn't matter what the band is used for.

http://bama.edebris.com/manuals/

This comming Sunday...

+++ Now even more Buyers Parking !!!
        Thanks to Shire we have use of their new parking lot

across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 16th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly, will be admitted FIRST.
Separate lines will form prior to gate opening for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ************

<<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

Thanks geek, Deek, and Don;
I'm using the BAMA manual. Still think a decimal
is not showing up on at least part of this copy. Will
try to psych it out.
Cheers,
Nelson

Nelson, I'm looking at an original HQ-100 book. There us no reference
in the book for an adjustment at 6 MHz. As I read the alignment
pictorial (Figure 7), the left rear-most can (T-1 antenna) is adjusted
at .6 MHz. The right, front-most can (L-3 oscillator)is adjusted as
follows: top slug is adjusted at .6 MHz, the bottom slug at 1.65 MHz.
Does this help?

Does anyone know where I can obtain 3 of these tubes?
I have tried the web with no result.
Any help will be greatly appreciated.

Try:

1. Antique Electronics Supply in Phoenix, AZ
2. Triode Electronics in Chicago
3. ESRC in Florida

I can't even find a datasheet on the thing... but it looks like a pentode designed for a battery-powered radio.... 1.5V filament, 90V plate.

I am thinking a 1LD5 or 1LC5 might be a reasonable sub, with a base adaptor.

I think it might be one of them furrin tubes from before the
standardized letter/number numbering system.

Maybe, but I found a bunch of circuits using it out there, like this one:
http://frank.pocnet.net/short/001/1/1SA6.gif which shows an IF stage.

This gives you basing and pinout, some nominal operating voltages, and you
can make a rough guess about transconductance.

It's a octal base, pentode RF amp.  The suggested replacement is a 1N5GT.

Any idea who made it?  My RCA data books cover the era when it must have been
made, but have no listing.

It's not in my 1955 GE book.  Not in a slightly newer Sylvania one either.

I got the tube info from my old Sylvania tube manual.  It was up-to-date
through mid-55.  The tube was listed in the condensed section, so it was
obsolete at the time it was printed.  Don't know who all made it.

The 1N5GT was fully documented, so it was somewhat modern at the time.

My RCA books have the 1N5GT well documented, as you say, but nothing on the 1SA6. They must not have thought it worth stealing. What do you suppose is the 6th element in the 1SA6?

There's no "sixth" element - it is a pentode. I have no idea why it's a "6"...

See here:

http://comcents.com/radios/1SA6GT.jpg

```

    There is condensed data in old editions of the _ARRL
Radio Amateur's Handbook_, I found it in the 1947 edition.

Often, the extra element is a shield. So I suppose that could be the
answer.

+++++++++++++
In good cosmetic and working condition, well over $500.  Rick Mish in
Toledo Ohio does good restoration work on these.

A local estate has one to dispose of. I suspect this was a companion
amplifier to the old HW-12-22-32 series monobonand Single Sidebanders.

Has anyone ever seen one of these? We can't find any mention of them
in Heath literature we've looked at.

Is it common or a rare oddidity?

Is there any colector value?

I don't remember seeing anything like that.  Heath did make a very
low slung power amplifier, close to the power limit, that had
potential as a mobile amplifier (I can't remember if it was really
intended for such use, but the low size made it more usable there,
and the other Don Miller (of SSTV fame) used one for a while mobile).

But that amplifier covered all the bands (except 160) available at
the time, which was the sixties.

If you don't have an actual Heath number, and haven't actually seen
it, isn't it more likely that the description is garbled?
  a multiband amplifier
  a non-Heath amplifier
  not even an amplifier

The Heath HA-14, and I believer there was a mobile power supply
available for it.
I built one in college for my home station even though it was
primarily sold as a mobile amp. It is essentially
the RF deck from the SB-200 and runs pair of 572Bs. The loading
control was "fixed"; which meant the antenna had to be near 50 ohms.
I ran that little amp pretty hard, even on RTTY once or twice, and it always
held up. And it was only a hundred bucks or so back then! I wish I still
had it.

Pete is right, the HA-14 was a 2 tube mobile ampflier, but it was not single
band (as I remember).  There was a mobile HV power supply as well that match
this unit.

After looking all year, I finally got my Hammarlund HQ-180A, have it set up and working here in the shack, and it sure works nice for a 50 year old boat anchor.

Now I'm looking for a transmitter to put with it. I'd really like a Heath DX-100B because that was my first transmitter back in 1962, but I'd kind of like SSB capability so I'm looking at a Marauder.

See
http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&rd=1&item=180159772887&ssPageName=STRK:MEWA:IT&ih=008

This one has come up for auction with a "buy it now" price of $195 (and a shipping charge from SC to NH of around $75 <grumble>).

The cabinet does look a little rough, and the chassis could stand some cleaning, but the front panel looks OK and if it works as well as the owner says it does, maybe $270 (including shipping) isn't too bad.

What do you all think?

It's a bit of a puzzle. Pin 1 is marked "S" meaning "metal shell, but that wouldn't apply to the GT version. Also it wouldn't be considered an element. If the tube had an internal shield it would be designated IS. No other elements are shown.

Rick, We all try and see what we want to see with this stuff.... After
I went through two Valiant disasters shipped in, I waited until a
confirmed good one became available, locally. I'd personally pass on
this one, even though it purportedly puts out power. It looks a bit to
rough for the bottom line you'll have to pay. The shipping always seems
to tip the scales. Just my opinion.... de K3HVG

The Mohawk and Apache had some complex mechanical arrangements. I have never examined the Marauder, but since it was a later model, I assume things were better.

I agree with Jeep (K3HVG). If you want one, get a good one that you can personally inspect. You might put an ad in Electric Radio and be willing to drive a few hundred miles to get just the right one.

Wives and radios are alike - always easier to start with a good one.

I need several manuals - NONE of them listed. Waste of time - hardly any military manuals listed - and most that are - can be found for free elsewhere on the net.

I've found MOST of my cv-89: the main frame and the filter back pack -
but no case (which included the ID of the connectors across the back).

Sure wish I knew what I did with the case!

Anyway - the CRT was dead - got one from ebay - and now it seems to
work. Time to hook it up and see if indeed it does. Probably needs
re-capping - so a schematic would be nice on all counts.

Thanks!

I have eleven oil-filled capacitors/condensors to give away. They have all been checked and are at their rated value or higher. They are as follows:

- Five 4 MFD 1000 VDC
- Two 0.5 MFD 2000 VDC
- One 10 MFD 600 VDC
- One 4 MFD 2500 VDC
- Two 10 MFD 200 VDC

Grey metal cans with porcelain supported terminals.

All to go as a lot. Shipping will be based on actual weight which is around 15 pounds.

Drop me a line with your ZIP code and I will pack-up, weigh and provide shipping amount. Money order or PayPal accepted.

```
Xref: g2news2.google.com rec.radio.amateur.boatanchors:1030
```

I have a TenTec Corsair II and matching TenTec Model 260 Power
Supply for sale. They are in very good cosmetic condition
with only a few minor scuffs and scratches on the cabinets and trim. The
Front Panels are very nice. The frequency readout is bright and clear and
the VFO
works good. No problems in tuning in CW or SSB. I don't know if it has been
rebuilt.
It receives very well and it puts out 90 to 100 watts output on all bands.
It comes
with the original manuals for the Corsair II and the TenTec 260 Power Supply
No mic or optional crystals are included.
Price for the station is $450 plus shipping from 79602. Digital pictures
available.
Thanks, Charlie Hugg, K5MBX

Hello,
I'm running short on options and am hoping someone will know where I may find tech data on the following oscillator. I've been looking for several weeks with no luck. At a minimum I would like to know the pin out for this device. Does anyone know how to do a Navair data search? Any help would be appreciated...

Thanks
Jim
WB5KYE

Here is what I know about the oscillator...

Austron# 1630-2R
NAVAIR# 247AS-CO393-001

This is a 10MHz oscillator with an octal base on the bottom. Unit is dated 1978.

Hi,

Just picked up a HP 410LR cheap. It came with no cables/wires besides the AC cord. That is, no probes. I understand to make full use of this instrument I will need some special probes. Where can I get a set? I plan to use it to calibrate my tape machine and to fix tube amplifiers in general.

Thanks,
Chris

HP410LR? That's a new one to me. I am aware of the 410A, 410B, and 410C, but not the LR. The 410(A,B,C) have their DC/Ohms probes wired directly to the instrument, and their AC probe has a vacuum tube diode in it, and plugs in by way of a Stereo Phone Plug.

Can you describe this instrument for us?

-Chuck

There may have been a cheap and easy way to get your VTVM working, but I see that your application will (may) require a.c. measurements. The DC, Ohms, and ground probes can be obtained on Ebay, etc. by buying a couple of sets of the military general purpose probe kits. Simply cut off the plug ends and directly connect them to your meter. Some HP 410's have the probes entering the front panel via small holes, others use a screw-on assembly on the lower front of the unit. I'm not familiar with the "LR" version. The problem is the ac probe. On the 410A,B, and C, (to include several military clones) the a.c. probe has a powered detector (diode) inside the bullet-shaped probe housing. Although any of the 410-series probes will interchangeably with the the above versions, I can't speak for the "LR". If you don't need frequency response and accuracy up to the rated 600MHz, you could use a simple detector diode and a resistive divider. You would need to re-calibrate the a.c function, of course. If, on the other hand, you're going to use a scope to measure a.c. signal voltages, you would not need the special a.c. probe.

Chuck is correct... on the "C" model, the a.c. probe uses a 1/4" stereo
plug.  The A, B, and MIL models are hard-wired either directly or via a
screw-on terminal assembly.

Sorry, it's a HP 400LR, a rack mount version of the 400L.

My unit has binding posts.

The 400 series meters are AC meters, they do not have DC or resistance ranges. The 400L is the same meter as the 400D and H other than the special meter movment which displays the voltage on a logrithmic scale and has a linear decibel scale uppermost. It does not need any special probes or accessories. The meter movment is a 1% tracking meter movement with a mirror scale to eliminate parallax similar to that used on the 400H. BTW, the only difference between the 400D and 400H is the meter movement and use of a mirror scale on the meter. Meters made after -hp- introduced taught-band meters all have the same tracking accuracy since each meter was individually calibrated by machine. The only difference here is the use of a mirror scale on the 400H, the 400D will also track to 1%.

There were at least three versions of the circuit used in 400D and H meters so you must get a handbook for the serial number series you have. The later meters used a circuit which is substantially different than the early meters.

Richard is correct. May I add that my HP400H, the model with linear scales, was full of black plastic encapsulated paper capacitors (sometimes called bumblebees or black beauties). These capacitors are well known for their failure rates. There may be a reason you got a good price on your meter.

Nope, very easy.  Just don't use disk ceramics.  Something in a polyester,
or polypropylene would do nicely.

     I am curious why you recommend against using disc
ceramics.
     BB's are found in a lot of high-quality equipment. They
were supposed to be high-performance deluxe caps when they
were sold but very quickly got a well deserved bad
reputation.

Hi Charlie,

Have you tried RF Parts?  Because they're inexpensive (compared to other
tubes), rather than taking a chance on used tubes, I'd go with new:
http://www.rfparts.com/572bprices.html.  FWIW, I recently replaced my 30
year old Eimacs w/ their house brand (Chinese-made) 3-500ZGs and they're
working fine in my SB-220.

Disk ceramics, particularly Z5U, or X7R, are a bad idea in any signal path. The feature that gives them high capacitance for their size also makes them highly piezoelectric: meaning they change physical dimension with applied voltage. This large change in dimension makes the capacitance non linear with voltage, and also makes the capacitor's power dissipation change with applied signal. That means distortion.

NPO's behave ok, but are of such low values that they would never be able to substitute for a capacitor such as a BB.

I have used Z5U ceramic capacitors in high signal areas and actually heard them "sing" along with the signal. Not a good thing!

Their capacitance is also extremely sensitive to temperature, which makes them useless in most timing applications. [I did use one once as a temperature transducer in a cheapy RF telemetry device...]

They work adequately in logic circuits as power supply bypass.

BB's are actually a pretty good capacitor, but they have a couple of failure mechanisms that render them useless over time. They are an oil filled paper capacitor with a black epoxy case. If you look at the banded end of the capacitor, you will notice the lead has a bulge where it leaves the case. That is actually a piece of brass tubing that was used in filling the case with oil. After the case was filled, the lead was stuck into the hole, swaged to keep it from falling out, and then soldered shut. The problem comes when the BB's banded lead is soldered into the circuit. If no heatsinking is used, the solder seal melts, and the oil spoils the seal. From that point forward, the oil will seep out of the capacitor, and moist air will seep in... it's a slow process that takes many thermal cycles, but we are talking about old stuff here. The other failure mechanism is the plastic case shrinks over time and breaks the seal around the leads, and sometimes even splits the case into pieces.

The BB's are all bad by now, and should be replaced on sight, but when they were new, they were a nice high performance capacitor.

-Chuck

I have recently found out that the AN/FRR-37 is essentially the same
as an AN/FRR-24 but with only two receiver racks (3 racks total) for
dual diversity. So I would appreciate any info on the AN/FRR-37 as
well.
I am still looking for parts or complete racks.
See http://www.virhistory.com/ham/frr24.htm

     OK about the ceramics. I think there must have been two
series of Black Beauty caps. Not all are oil filled. The
ones I removed from an SP-600-JX for instance, are paper
impregnated with polyester plastic. They are dry and don't
have filler tubes. I suspect the main failure mode for these
is due to the incapsulation. Many seem to have cracked and
even those which have not cracked often have low capacitance
and high dissipation factor. The capacitor winding is
usually physically distorted, flattened for instance. I
suspect that the case shrinks distoring it and also may
allow moisture to enter. These caps were supposed to be much
better than the wax coated paper caps of the time.
     Sprague also made a similar capacitor, that is a dry
polyester impregnated paper cap, but in epoxy-dipped casings
called Orange Drops. AFAIK, these have proven quite reliable
and long lived, giving some support to my idea that it was
the molded cases of the BBs that failed.
     BBs are found in a lot of high-quality equipment,
General Radio, Hewlett-Packard, etc, used a lot of them.

Human natures are fine tuned for gene pool survival.

The way we evolve in the gene pool is that when we're not at war, we're in a race.

Peace and freedom means competition. Some people are uncompetitive. So they don't want to compete. Those people demand slavery.More...

Those who demand slavery are not necessarily poorer or richer, superior or inferior. Those are people that somehow do not like competition.

The farm owning farmers in southern US, for example, do not want to compete with the higher salary the industrial north has, so they demand slavery. This happens despite the fact that the landlords are already way richer than their slaves.

Uncompetitive businesses also do not want customers to be free to choose the best products. They demand enslavements of consumers by restricting consumers choice to choose better products.

As time goes by and consensual productive means to aquire wealth become available, those who oppose competition tends to be the one inferior.

When we're not at war, we're in a race. So in a sense, some part of life is a zero-sum game. The happiness of some superior competitors correlate with gene pool survival of such people. This correlate with the extinction of inferior people and this make inferior people unhappy....page...

For example, women prefer rich smart males and normal males prefer as many females as possible. Actually poor males prefer more money rather than more women, but that's later.

If rich smart males get more females, then rich smart alpha males will survive better in the gene pool. That means, the other males do not get any. Hence, the lesser males will not be happy. They will then come up with monogamy to ration females in equal share for everyone.

Those who are uncompetitive are not going to say honestly that they are disgruntled competitors. They're going to come up with some religious unscientific fairy tales to come up with pretext that freedom, such as free sex is wrong.

In short, whenever someone is happy, whenever something gives pleasure, happiness, and money, you can count that someone, somewhere, somehow, will come up with some fairy tales of who knows what that somehow it's wrong, bad, and should be prohibited.

The preference to snuff of happiness earned by others are called envy. In a sense, those who want to be happy are meant to kill each other with those who are envious.

Unless those who run the fastest also hit the hardest, success is simply a bridge to a gas chamber. Deviation from free fair competition turns life into some form of gun fight.

Not everyone can be appeased in a gun fight. Envy is simply unappeasable. The way to keep pursuing our happiness and still be alive is either to kill, or threaten to kill, those who are envious of us that it's not to their best interests to kill or prosecute us....page...

That's why I strongly support death penalty. Without it, all succesful people will be slaughtered by bigots that don't mind going to jail for it.

It's also the same reason why many ugly women oppose porn. That's because those women are envy bigots.

Think of it this way. Pretty women can just show some skin and make millions of dollars. Ugly women has to sexually serve poor males and get knocked up for much less money.

If this keeps going, pretty women can pick the best males with the best genes and provide their sons with better education, opportunity, and more initial start up capital.

The pretty genes will survive better in the gene pool and the ugly will be outcompeted, like in Europe or Japan. All thanks to porn.

Obviously, pretty porn stars are way better of then ugly wife. Becoming a porn star or prostitute is then one of the best job ever in this world.

However, out of envy, ugly women will want to prevent that. What's their justification? By saying that all the good jobs are so bad that it can't possibly consensual, and hence has to be prohibited.

They said that porn should be prohibited to protect women. Which women? Not the consenting one of course. How in the earth people get protected from consensual offers anyway. It's there to protect disgruntled envy competitors.

> impregnated with polyester plastic. They are dry and don't have filler tubes. I suspect the main failure mode for these is due to the incapsulation. Many seem to have cracked and even those which have not cracked often have low capacitance and high dissipation factor. The capacitor winding is usually physically distorted, flattened for instance. I suspect that the case shrinks distoring it and also may allow moisture to enter. These caps were supposed to be much better than the wax coated paper caps of the time.
>
> Sprague also made a similar capacitor, that is a dry polyester impregnated paper cap, but in epoxy-dipped casings called Orange Drops. AFAIK, these have proven quite reliable and long lived, giving some support to my idea that it was the molded cases of the BBs that failed.
>
> BBs are found in a lot of high-quality equipment, General Radio, Hewlett-Packard, etc, used a lot of them.

There are Black Beauties, and there are Black Beauties!

The oil filled Black Beauties, in my experience, always have color coded bands that tell the ratings. They were a premium capacitor, and as such were quite expensive.

The polyester dielectric capacitors have black bodies, with red lettering. I recall that they came out after the oil filled capacitors.

Orange drops were a step up from the waxed paper capacitors, and a step down from the molded polyester black beauties. They were designed especially for printed circuit board use. Orange drops were a relatively cheap "jobber" capacitor, but they have certainly withstood the test of time quite well.

All the BBs I've seen had colored stripes indicating the capacitance value and other data. These were dry caps. Not dried out oil-filled, there was no trace of oil or means of adding it.

According to Sprague advertising of the time (early 1960s) the BB and Orange Drop had identical construction other than the encapsulation and radial leads on the ODs. I don't have catalogue info giving prices. The ODs were evidently made for printed circuit installation as you say and were probably smaller due to the dipped rather than molded case. I am not sure what the case of the BBs is made of, it appears to be a resin plastic such as Bakelite which was widely used at the time. Bakelite can shrink and depends very much on the filler used for longevity. They may have been made of something else. In any case, its of academic interest now. I remember having been warned not to use BBs as early as highschool, meaning the late 1950's. Also, the Hammarlund receivers began to be rebuilt with disc ceramics about the late 1950's so the trouble must have shown up within a few years. Sprague continued building the cap so, perhaps, the cause of the problem was discovered. They _should_ have been a superior capacitor. Too bad.

I don't see any strip line. Best I'd give it is "nice front panel."

Well, you look at the copper strap connecting the 6 meter tank to the tubes.
Those.are called "strip lines" and are what resonates the tank on 2 meters.

Now to replace those 4CX250s with 3CX800s or a pair of 4CX*** in that
range <:-)).  I'm using a single 3CX800 on 2-meters. It's just the
thing for WAR (Worked all Repeaters) <:-)) and no in case anyone took
me serious, it's for SSB and CW although I keep telling the locals
it's for packet.
